

Sophos Endpoint Security and Control delivers protection across Windows, Mac, Linux and other non-Windows platforms, safeguarding desktops, laptops, file servers and mobile devices and unifying control of good, bad and suspicious code and behaviour. In a single scan, it delivers complete integrated protection against viruses, spyware, adware, and hackers and lets you control unauthorised installation and use of software applications including VoIP, IM, P2P, internet browsers, media players and games.

Single scan, single agent

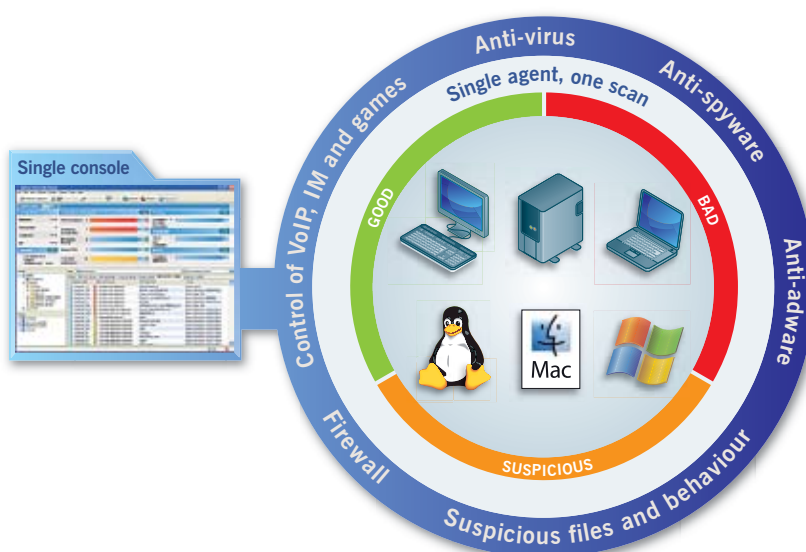

You don't need to manage multiple point products to stop different threats. Our unified single client protects against viruses, spyware, adware, and potentially unwanted applications (PUAs). You can even control what your staff install and prevent them from using unauthorised software such as Instant Messaging (IM), Voice over Internet Protocol (VoIP), peer-to-peer (P2P) applications, and games.

One simplified, automated console

Our automated console provides a single point from which to deploy, update and report on both anti-virus, anti-spyware and firewall protection across thousands of Windows, Mac and Linux computers. By simplifying and automating protection, we drive down your costs, ensuring fewer clicks per task and better visibility of your entire network.

Faster, better protection

SophosLabs' malware, spam, application and web expertise ensures you get the fastest and best protection against blended threats. Behavioral Genotype® Protection and rapid signature updates combine to stop new and unknown malware and ensure we regularly beat Symantec and McAfee in independent tests.

Key benefits

- » Manages and controls protection on tens of thousands of computers with powerful but easy-to-use software
- » Controls applications that can adversely impact network and user productivity, such as VoIP and IM
- » Eliminates multiple known and unknown threats with a single, centralised solution
- » Ensures proactive, zero-day protection, prevents intrusion and proactively stops application hijacking and impersonation
- » Lets you rapidly create and update security policies, and deploy them across multiple groups simultaneously
- » Receives and centrally deploys the smallest, fastest automatic updates every five minutes
- » Protects all platforms including Windows, Windows Mobile, Macintosh, Linux, NetWare, UNIX and NetApp Storage Systems
- » Remotely detects and removes viruses, spyware, Trojans and blocks PUAs
- » Allows quick deployment of protection through flexible and efficient computer discovery using built-in search, Microsoft Active Directory data, or search by IP subnet ranges
- » Lets you focus instantly on vulnerable computers to check compliance, update policies and clean up threats
- » Provides role-based administration privileges assigned with Helpdesk and Read-Only Consoles
- » Enables a wide range of customised, graphical reports to be created on virus alerts, infections and status of protection
- » Includes 24x7x365 support for the duration of the licence and one-to-one assistance

Security and control for every computer on your network

Supporting the widest range of platforms in the industry, Sophos Endpoint Security and Control provides complex networks with rapid, integrated proactive protection against known and unknown malware, adware and PUAs. It also lets you control and optionally block applications which are legitimate but which you might not want users running, such as Instant Messaging. Centrally installed, configured and monitored across the network, it updates automatically with the latest protection from SophosLabs as frequently as every five minutes.

- Windows protection detects and removes viruses, spyware, adware and PUAs, and controls the use of unauthorised applications.
- Protection for Mac OS X supports both Intel-based and PowerPC-based computers, allows Windows malware to be deleted and cleaned on a Mac OS X computer, and enables scheduled updating and configuration from Sophos Enterprise Console or a single Mac computer.
- Detection and disinfection of viruses, spyware, Trojans, and worms in real time ensures full network protection not just on Windows but on other platforms such as NetWare, Linux and many versions of UNIX.
- There is out-of-the-box support for the widest range of Linux distributions, and Linux desktops, laptops and servers can all be scanned on access.
- All files are scanned on access as they are written to or read from NetApp Storage Systems Network Appliance filers.
- On-access, on-demand or scheduled scanning detects and quarantines malware on Windows Mobile devices, while visual and email alerts provide notification of blocked threats. You can also create and lock down company-wide security policies for your mobile devices using a configuration tool.

Improved performance through a single, unified detection engine

Sophos's powerful detection engine provides cross-threat protection at every vulnerable entry point, in a single scan. Eliminating the need for, and overhead of, separate standalone products, the Sophos engine combines anti-malware detection with built-in intrusion prevention and detects viruses, spyware, adware, suspicious files, suspicious behaviour and unauthorised VoIP, IM, P2P and gaming software.

- Integrated detection of threats and single scanning for good, bad and suspicious code brings significant improvements in network performance and reduction in IT costs.
- Genotype® virus detection technology proactively blocks families of viruses even before specific virus signatures are available.
- Behavioral Genotype Protection, our built-in intrusion prevention technology, proactively protects against zero-day malware, detecting new threats before code even begins to execute.
- Sophos behavioural rulesets are constantly validated against an extensive library of legitimate applications, to ensure accurate detection.
- Decision Caching™ technology improves on-access scanning performance by intercepting and scanning only files that have changed since last accessed.

Software components

Enterprise Console

A single, automated console that manages anti-virus, client firewall, intrusion prevention and application control across thousands of Windows, Mac and Linux computers.

Sophos Anti-Virus

A single anti-virus client that detects viruses, spyware and adware, suspicious files, suspicious behaviour and unauthorised VoIP, IM, P2P and gaming software across multiple platforms in just one scan.

Sophos Client Firewall

A centrally managed client firewall, designed for the enterprise environment, that blocks worms, stops hackers, and prevents intrusion from hackers.

Sophos Mobile Security

Anti-virus and anti-spyware protection for Windows Mobile smartphones and PDAs.

Reducing complexity and cost

Through our automated, single console – Sophos Enterprise Console – Sophos Endpoint Security and Control provides scalable security management across tens of thousands of computers. It enables deployment and update of Sophos Anti-Virus and Sophos Client Firewall across the network – including remote computers – from a single point. It also allows centralised cleanup of malware, policy enforcement, and selective authorisation of potentially unwanted applications, such as adware. Role-based administration tools allow you to define and limit console access to only those groups and remediation tasks for which members of your team have responsibility.

- You can manage tens of thousands of Windows, Mac OS X and Linux computers from a single console, and benefit from unrivalled visibility of security status across the entire network.
- The console synchronises with Active Directory to ensure your chosen security policy is automatically enforced as new computers join your network.
- Outbreak risk levels across the entire network are displayed on the security dashboard and automatic email alerts are sent when your chosen security thresholds are threatened.
- You get a complete intrusion prevention system (HIPS) without complex installation and configuration – runtime analysis, buffer overflow and unique pre-execution protection proactively detect malware, suspicious files and behaviour, and are managed from the single console.
- ActivePolicies™ in the console allows you to create a policy once and then apply it across multiple groups, across Windows, Mac and Linux computers, and across all versions of Sophos Anti-Virus.
- ActivePolicies™ reduces the recurring management costs associated with anti-virus, anti-spyware, anti-adware, client firewall and intrusion prevention, and now include controlling unauthorised VoIP, P2P, and IM use.
- Administrators can delegate limited access to trusted users without handing over full administration capabilities. Helpdesk Console allows users to take specific remediation actions, while Read-Only Console allows them a view of the situation but without the permission to take any action.
- Your protection is automatically updated as frequently as every five minutes – and because you control the download rate, you can preserve bandwidth.
- Integrated graphical reporting delivers instant and scheduled email reports of threat alerts and infections while the security dashboard gives you an at-a-glance report of outbreak risk.
- Endpoint computers can be completely disinfected in a single, simple operation from the console.
- You can search via the built-in Sophos search-and-find mechanism, which uses any existing Active Directory data, or by IP subnet ranges.

Technology bytes

ActivePolicies™

Lets you create a new security policy once and then deploy it across multiple groups simultaneously

Application Control

Allows you to selectively authorise or block legitimate applications that impact network bandwidth, system availability, and user productivity

Behavioral Genotype Protection

Delivers the benefits of a Host Intrusion Prevention System (HIPS), guarding against unknown threats by analysing behaviour before code executes

Centralised cleanup

Lets you deal with malware and PUAs remotely from a central location, saving time and cost

Checksumming

Enables Sophos Client Firewall to prevent application hijacking and impersonation by spyware and other malware

Decision Caching™

Provides performance-enhanced on-access scans by ensuring that only those files that have changed are scanned

Genotype® technology

Provides proactive protection from new variants of virus and spam families, even before specific, signature-based protection becomes available

Smart Views

Lets you instantly focus on vulnerable computers – including remote computers – to check compliance, update policies and clean up threats

Sophos AutoUpdate™

Offers failsafe updating and can throttle bandwidth when updating over low-speed network connections

SQL database support

Caters for the increased data storage requirements of even the largest network, while the built-in MSDE database will satisfy most organisations' requirements

Stealth mode

Lets Sophos Client Firewall prevent computers responding and falling victim to hacker attacks

SophosLabs – knows the threat better than anyone

Highly skilled analysts in SophosLabs™, our global network of threat analysis centres, build on our 20 years' experience to provide all Sophos customers with proactive rapid protection against known and unknown threats. Through technology, global visibility of emerging threats, and integrated threat expertise, SophosLabs provides the 24/7 research and fast global response your organisation needs to protect it from increasingly complex threats.

Industry-leading, 24/7 support

Our round-the-clock technical customer support operation is included as standard in your licence and you'll receive unlimited access to our highly acclaimed customer support team. You can contact our engineers for one-to-one support by email or telephone, or use our web-based support knowledgebase. Working from support centres around the world, our experts draw on a wealth of experience and technology to replicate, analyse, and resolve your problems fast.

Simple pricing and licensing

One per-user subscription-based licence gives you not just today's software but all future updates to protection, management and product upgrades, as well as technical support. You can also include our Web Security and Control, Email Security and Control, and NAC services all in the same licence.

Languages supported

English, French, German, Italian, Japanese, Spanish, Simplified and Traditional Chinese
