

Manage All External Cloud Connections with Novell® Cloud Security Service

With Novell® Cloud Security Service, you can leverage your existing identity infrastructure to access all your cloud applications and get consistent compliance tracking.

What Is Novell Cloud Security Service?

Novell Cloud Security Service is a Web-based identity and access management service that makes SaaS, PaaS and IaaS applications more secure for the enterprise. This service acts as a trusted identity broker between you and cloud providers, and is based on open standards. This means it supports translations between all the major standards in the market today. Some of the many benefits you receive include the following:

Ability to Extend Your Internal Policies to the Cloud

You have already invested time and resources into your identity and access infrastructure. With Novell Cloud Security Service, you can leverage your existing infrastructure to securely access cloud applications and enforce your internal policies and roles in the cloud.

Single Sign-On

Novell Cloud Security Service allows your employees and partners to remember just one user name and password to access all authorized Web-based services. Our solution leverages industry standards to

enable single sign-on using the enterprise identity infrastructure.

Just-in-Time User Provisioning

Having multiple SaaS applications increases IT maintenance time and costs. Now, when a user is created or deleted in the enterprise, that access information is automatically reflected in all the applications.

Comprehensive Audit Logs

Audit logging is critical to your organization and is a specific requirement of many regulatory and standards bodies. Our solution eliminates these concerns by tracking and reporting compliance events from the cloud back to the enterprise.

Control of Sensitive Information in the Cloud

Many solutions in the market provide identity management in the cloud; however, they deliver this service by opening firewall ports, something that IT administrators don't like to do. Novell Cloud Security Service is the only solution in the market today that is firewall friendly and controls sensitive information in the cloud using an implementation approach called "annexation."

What makes the Novell solution different? Our solution offers true enterprise-ready identity, access and compliance solutions for your cloud environment.

www.novell.com

The Ability to “Connect Once, Deploy Everywhere”

Different cloud providers have different methods of accepting and verifying identity and access information. This requires you to have multiple approaches for enabling single sign-on and communicating access rights. Our solution takes care of the integration hassle because it supports numerous industry standards. This makes it easy for you to connect to every cloud application.

How Does Novell Cloud Security Service Work?

Novell Cloud Security Service is hosted in the cloud, either where the provider hosts its application or via a Novell hosting partner.

A user can log on via the enterprise identity system or directly to Novell Cloud Security Service (as illustrated above). The service first

verifies the identity, and if successful, it generates an identity token in the format needed by the SaaS provider. The user is now authenticated to the SaaS architecture.

What Makes the Novell Solution Different?

Novell Cloud Security Service goes beyond federating and single sign-on to provide the only truly secure solution for your needs. In addition, our unique solution offers:

- Consolidated compliance monitoring and management dashboards across vendors
- Sharing of roles, policies and workflows in the cloud
- Support for multiple standards, which offers true interoperability
