About This Guide

This guide gives an overview of OpenWBEM services and Common Information Model (CIM) technologies included with Novell Open Enterprise Server (OES) 2 and how they relate. It also describes how to implement these services in your network and configure the OpenWBEM Common Information Model Object Manager (CIMOM) on an Open Enterprise Server running SUSE Linux.

This guide is divided into the following sections:

- Chapter 1, “Overview,” on page 7
- Chapter 2, “What’s New for OpenWBEM,” on page 9
- Chapter 3, “Migrating OpenWBEM from NetWare to OES 2 Linux,” on page 11
- Chapter 4, “Running OpenWBEM in a Virtualized Environment,” on page 13
- Chapter 5, “Setting Up OpenWBEM,” on page 15
- Chapter 6, “Changing the OpenWBEM CIMOM Configuration,” on page 19
- Chapter 7, “Security Considerations,” on page 35

Audience

This guide is intended for network administrators.

Feedback

We want to hear your comments and suggestions about this manual and the other documentation included with this product. Please use the User Comments feature at the bottom of each page of the online documentation, or go to www.novell.com/documentation/feedback.html and enter your comments there.

Documentation Updates

For the most recent version of the OES 2: OpenWBEM Services Administration Guide, see the Open Enterprise Server online documentation (http://www.novell.com/documentation/oes2/cimom/data/front.html#bktitle).

Additional Documentation

For more in-depth information about the Distributed Management Task Force (DMTF) and its standards, see the DMTF Web site (http://www.dmtf.org/home).

For more information on the open source project OpenWBEM, see the OpenWBEM Web site (http://openwbem.org).
Novell Open Enterprise Server (OES) 2 has embraced the open standard strategies of Web-Based Enterprise Management (WBEM) proposed by the Distributed Management Task Force (DMTF) (http://www.dmtf.org/home). Implementing these strategies can substantially reduce the level of complexity associated with managing disparate systems in your network.

The following information describes a few of the components proposed by the DMTF standards. Understanding what these are and how they relate to each other can help you understand what OpenWBEM is and how you most effectively use it in your network.

- Web-Based Enterprise Management (WBEM) is a set of management and Internet standard technologies developed to unify the management of enterprise computing environments. WBEM provides the ability for the industry to deliver a well-integrated set of standards-based management tools leveraging the emerging Web technologies. The DMTF has developed a core set of standards that make up WBEM:
  - A data model: the Common Information Model (CIM) standard
  - An encoding specification: CIM-XML Encoding Specification
  - A transport mechanism: CIM Operations over HTTP
- The Common Information Model (CIM) is a conceptual information model for describing management that is not bound to a particular implementation. This allows for the interchange of management information between management systems and applications. This can be either agent-to-manager or manager-to-manager communications that provide for distributed system management. There are two parts to CIM: the CIM Specification and the CIM Schema.

The CIM Specification describes the language, naming, and meta schema. The meta schema is a formal definition of the model. It defines the terms used to express the model and their usage and semantics. The elements of the meta schema are Classes, Properties, and Methods. The meta schema also supports Indications and Associations as types of Classes, and References as types of Properties.

The CIM Schema provides the actual model descriptions. The CIM Schema supplies a set of classes with properties and associations that provide a well-understood conceptual framework within which it is possible to organize the available information about the managed environment.

- The Common Information Model Object Manager (CIMOM) is a CIM object manager or, more specifically, an application that manages objects according to the CIM standard.
- CIMOM providers are software that performs specific tasks within the CIMOM that are requested by client applications. Each provider instruments one or more aspects of the CIMOM's schema.

Open Enterprise Server contains the CIMOM from the OpenWBEM project (http://openwbem.org). The packages contained in the Web-based Enterprise Management pattern in the Primary Functions category (on Linux) or the OWCIMOMD include a set of basic Novell providers, including some sample providers, and a base set of accompanying Novell schemas.
As Novell moves forward with OpenWBEM and development of specific providers, it will provide tools that offer the following important features:

- Efficient monitoring of network systems
- Recording of alterations within existing management configurations
- Hardware inventory and asset management

Understanding how the OpenWBEM CIMOM is set up and how to configure it can help you monitor and manage disparate systems in your network with more confidence and ease.

## 1.1 What's Next

For information about the tasks you might want to perform, see the following table.

<table>
<thead>
<tr>
<th>Task</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>Learn about coexistence and migration issues.</td>
<td>“Migrating OpenWBEM from NetWare to OES 2 Linux” on page 11</td>
</tr>
<tr>
<td>Setting Up OpenWBEM</td>
<td>“Setting Up OpenWBEM” on page 15</td>
</tr>
<tr>
<td>Learning about virtualization differences</td>
<td>“Running OpenWBEM in a Virtualized Environment” on page 13</td>
</tr>
<tr>
<td>Configuring OpenWBEM</td>
<td>“Changing the OpenWBEM CIMOM Configuration” on page 19</td>
</tr>
<tr>
<td>Ensure the server and data are secure</td>
<td>“Security Considerations” on page 35</td>
</tr>
</tbody>
</table>
The features and capabilities in this section were added for OpenWBEM since the initial release of Novell Open Enterprise Server 2.

- Section 2.1, “What’s New (April 2013 Patches),” on page 9
- Section 2.2, “What’s New (January 2013 Patches),” on page 9
- Section 2.3, “OES 2 SP3,” on page 10
- Section 2.4, “OES 2 SP2,” on page 10
- Section 2.5, “OES 2 SP1,” on page 10
- Section 2.6, “OES 2,” on page 10

2.1 What’s New (April 2013 Patches)

The April 2013 Scheduled Maintenance for OES 2 SP3 includes a channel upgrade to Novell eDirectory 8.8 SP7. For information, see TID 7011599 (http://www.novell.com/support/kb/doc.php?id=7011599) in the Novell Knowledgebase.

2.2 What’s New (January 2013 Patches)

- Section 2.2.1, “Upgrade to Novell iManager 2.7.6,” on page 9
- Section 2.2.2, “Novell Client Support for Windows 8 and Server 2012,” on page 10

2.2.1 Upgrade to Novell iManager 2.7.6

The January 2013 Scheduled Maintenance for OES 2 SP3 includes a channel upgrade from Novell iManager 2.7.4 to Novell iManager 2.7.6.

Novell iManager 2.7.6 provides the following enhancements:

- Microsoft Internet Explorer 10 certification on Windows 8 (excluding Windows 8 RT) and Windows Server 2012. iManager 2.7.6 does not support the Metro user interface view for Internet Explorer 10.
- Apple Safari 6.0 certification on Mac OSX Mountain Lion (version 10.8).
- iManager Workstation certification on Windows 8 Enterprise Edition (32-bit and 64-bit).
- Manager 2.7.6 support for Tomcat 7.0.32. and Java 1.7.0_04 versions.

iManager documentation links in this guide have been updated to reflect this change.

iManager 2.7.6 documentation is available on the Web (https://www.netiq.com/documentation/imanager/). For earlier iManager versions, see “Previous Releases” (https://www.netiq.com/documentation/imanager27/#prev).
2.2.2 Novell Client Support for Windows 8 and Server 2012

The January 2013 Scheduled Maintenance for OES 2 SP3 announces the availability of Novell Client 2 SP3 for Windows with support for:

- Windows 8 (32-bit and 64-bit) excluding Windows 8 RT
- Windows Server 2012 (64-bit)

Novell Client 2 documentation links in this guide have been updated to reflect the release of SP3.

Novell Client 2 SP3 for Windows documentation is available on the Web (http://www.novell.com/documentation/windows_client/). Documentation for earlier versions is available under Previous Releases (http://www.novell.com/documentation/windows_client/#previous).

2.3 OES 2 SP3

There are no changes to OpenWBEM for OES 2 SP3.

2.4 OES 2 SP2

There are no changes to OpenWBEM for OES 2 SP2.

2.5 OES 2 SP1

There are no changes to OpenWBEM for OES 2 SP1.

2.6 OES 2

OpenWBEM in Open Enterprise Server 2 includes the following features that were not in the initial release of OES 1:

- For OES 2 Linux, OpenWBEM software packages are distributed by the SUSE Linux Enterprise Server 10 software rather than added on by the OES software.
- The version of OpenWBEM for Linux is version 3.2.
3 Migrating OpenWBEM from NetWare to OES 2 Linux

The section contains the following information:

- Section 3.1, “Coexistence,” on page 11
- Section 3.2, “Migration,” on page 12

3.1 Coexistence

This section provides information regarding the compatibility and coexistence of OpenWBEM Services with existing networks containing OES 2 NetWare or Linux platforms.

3.1.1 Compatibility

The following table summarizes the compatibility of OpenWBEM Services with various operating systems:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Compatible Versions</th>
<th>Version of OpenWBEM</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetWare</td>
<td>OES 2 on NetWare</td>
<td>3.1</td>
</tr>
<tr>
<td>NetWare</td>
<td>OES 1 on NetWare</td>
<td>3.1</td>
</tr>
<tr>
<td>NetWare</td>
<td>NetWare 6.5 SP3 or later</td>
<td>3.1</td>
</tr>
<tr>
<td>Linux</td>
<td>OES 2 on Linux</td>
<td>3.2</td>
</tr>
<tr>
<td>Linux</td>
<td>OES 1 on Linux</td>
<td>3.1</td>
</tr>
<tr>
<td>Linux</td>
<td>SUSE Linux Enterprise Server 9 SP1 and later</td>
<td>3.1</td>
</tr>
<tr>
<td>Linux</td>
<td>SUSE Linux Enterprise Server 10 and later</td>
<td>3.2</td>
</tr>
</tbody>
</table>

3.1.2 Coexistence Issues

Unknown.
3.2 Migration

When you migrate different OES 1 services from NetWare to OES 2 Linux, the services should automatically convert their use of OpenWBEM on NetWare version 3.1 to OpenWBEM on OES 2 Linux. You do not need to take any manual steps to make this conversion.

If you have modified the openwbem.conf file for your NetWare environment, you might want to make the same type of changes in the openwbem.conf file on Linux.

On OES Linux, the openwbem.conf file is the same name as it is for NetWare but file locations and settings are different, so you cannot copy the file directly from NetWare to an OES Linux server. The concepts are the same, so you can use the information from the NetWare openwbem.conf file to guide you in setting up the configuration on OES Linux. For all differences, see “Changing the OpenWBEM CIMOM Configuration” on page 19.
OpenWBEM runs in a virtualized environment just as it does on a physical server running OES 2 Linux and requires no special configuration or other changes.

For information on setting up virtualized OES 2 Linux, see “Installing, Upgrading, or Updating OES on a Xen-based VM” in the OES 2 SP3: Installation Guide guide.
5 Setting Up OpenWBEM

This section includes the following information:

- Section 5.1, “Installing OpenWBEM,” on page 15
- Section 5.2, “LUM-Enabling OpenWBEM During OES 2 Linux Installation,” on page 15
- Section 5.3, “Starting, Stopping, or Checking Status for OWCIMOMD,” on page 15
- Section 5.4, “Ensuring Secure Access,” on page 16
- Section 5.5, “Setting Up Logging,” on page 18

5.1 Installing OpenWBEM

When you install any component of OES 2 on Linux that is dependent on OpenWBEM packages, the OpenWBEM packages are installed automatically.

If you want to install only OpenWBEM, you only need to select the Web-Based Enterprise Management pattern from the Primary Functions category of the Software Selection page.

5.2 LUM-Enabling OpenWBEM During OES 2 Linux Installation

During the installation of OES 2 Linux or when adding OES 2 Linux on an existing server, ensure that you LUM-enable OpenWBEM when you are configuring LUM. This is the default setting.

If OpenWBEM is not LUM-enabled, the following services might not work as designed on an OES 2 Linux server:

- Novell iPrint
- Novell Remote Manager (NRM)
- Novell Samba
- Novell Storage Services (NSS)
- Storage Management Services (SMS)

5.3 Starting, Stopping, or Checking Status for OWCIMOMD

When OpenWBEM is installed, it installs and starts the OpenWBEM cimom daemon (OWCIMOMD) by default on OES on Linux. Information in the following table explains how to start, stop, and check status for OWCIMOMD.
5.4 Ensuring Secure Access

The default setup of OpenWBEM is relatively secure. However, you might want to review the following to ensure access to OpenWBEM components is as secure as desired for your organization.

- Section 5.4.1, “Certificates,” on page 16
- Section 5.4.2, “Ports,” on page 16
- Section 5.4.3, “Authentication,” on page 17

5.4.1 Certificates

Secure Socket Layers (SSL) transports require a certificate for secure communications to occur. When OES is installed, OpenWBEM has a self-signed certificate generated for it.

If desired, you can replace the path for the default certificate with a path to a commercial certificate that you have purchased or with a different certificate that you have generated in the http_server.SSL_cert = path_filename setting in the openwbem.conf file.

The default generated certificate is in the following location:

/etc/openwbem/servercert.pem

If you want to generate a new certificate, use the following command. Running this command replaces the current certificate, so Novell recommends making a copy of the old certificate before generating a new one.

1 As root in a console shell, enter sh /etc/openwbem/owgencert.

If you want to change the certificate that OpenWBEM uses, see “Changing the Certificate Configuration” on page 24.

5.4.2 Ports

OpenWBEM is configured by default to accept all communications through a secure port, 5989. Information in the following table explains the port communication setup and recommended configuration.
Table 5-2  Port Communication Setup and Recommended Configurations

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Notes and Recommendations</th>
</tr>
</thead>
<tbody>
<tr>
<td>5989</td>
<td>Secure</td>
<td>The secure port that OpenWBEM communications use via HTTPS services.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This is the default configuration.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>With this setting, all communications between the CIMOM and client applications are encrypted when sent over the Internet between servers and workstations. Users must authenticate through the client application to view this information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Novell recommends that you maintain this setting in the configuration file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In order for the OpenWBEM CIMOM to communicate with the necessary applications, this port must be open in routers and firewalls if they are present between the client application (iManager plug-in) and the nodes being monitored.</td>
</tr>
<tr>
<td>5988</td>
<td>Non-secure</td>
<td>The non-secure port that OpenWBEM communications use via HTTP services.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This setting is disabled by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>With this setting, all communications between the CIMOM and client applications are open for review when sent over the Internet between servers and workstations by anyone without any authentication.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Novell recommends that you use this setting only when attempting to debug a problem with the CIMOM. As soon as the problem is resolved, set this back to the secure port, 5989.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In order for the OpenWBEM CIMOM to communicate with the necessary applications, this port must be open in routers and firewalls if they are present between the client application (iManager plug-in) and the nodes being monitored.</td>
</tr>
</tbody>
</table>

If you want to change the default port assignments, see “Changing the Port Configuration” on page 25.

5.4.3 Authentication

The following authentication settings are set and enabled as the default for each platform for OpenWBEM in OES.

You can change any of the default settings. See “Changing the Authentication Configuration” on page 19.

On Linux, the following settings are default:

- `http_server.allow_local_authentication = true`
- `http_server.ssl_client_verification = disabled`
- `http_server.use_digest = false`
- `owcimomd.allow_anonymous = false`
- `owcimomd.allowed_users = *`
- `owcimomd.authentication_module = /opt/novell/lib/openwbem/authentication/libnovellauthentication.so`

On Linux, the OpenWBEM CIMOM is PAM-enabled; therefore the following can occur:

- Local users can authenticate to the OpenWBEM CIMOM with local user credentials.
• If LUM is installed on the server where the OpenWBEM CIMOM is running, then the LUM-enabled user can authenticate to the OpenWBEM CIMOM.

• If a LUM-enabled user has the Supervisor right for the Entry Rights property for the UNIX Workstation object that represents the Linux server, the OpenWBEM CIMOM grants that user Root privileges to that Linux server.

5.5 Setting Up Logging

By default, logging for OpenWBEM is set up as follows.

You can change any of the default settings. For more information, see “Changing the Default Logging Configuration” on page 26.

On Linux, the following settings are default:

• log.main.components = *
• log.main.level = ERROR
• log.main.type = syslog

This means that OWCIMOMD logging is set up to go to the /var/log/messages file or to other files depending on the configuration of syslogd. It logs all errors for all components (OWCIMOMD).
Changing the OpenWBEM CIMOM Configuration

When OpenWBEM CIMOM (OWCIMOMD) starts, it receives all of its commands for running from the `openwbem.conf` file. The `openwbem.conf` file is located in the `/etc/openwbem/openwbem.conf` folder.

Any setting that has the options commented out with a semicolon (;) or pound sign (#) uses the default setting.

When making changes to this file, you can use any text editor that saves the file in a format that is native to the platform you are using.

You can change any of the settings in the `openwbem.conf` file. This section discusses the following configuration settings:

- Section 6.1, “Changing the Authentication Configuration,” on page 19
- Section 6.2, “Changing the Certificate Configuration,” on page 24
- Section 6.3, “Changing the Port Configuration,” on page 25
- Section 6.4, “Configuring CIMOM Daemons to Bind to IP Addresses,” on page 26
- Section 6.5, “Changing the Default Logging Configuration,” on page 26
- Section 6.6, “Configuring Debug Logging,” on page 31
- Section 6.7, “Configuring Additional Logs,” on page 32

6.1 Changing the Authentication Configuration

When changing the Authentication configuration, there are several things that you can control:

- Who can access the CIMOM
- What authentication module is used

See the following settings:

- Section 6.1.1, “http_server.allow_local_authentication,” on page 20
- Section 6.1.2, “http_server.digest_password_file,” on page 20
- Section 6.1.3, “http_server.ssl_client_verification,” on page 21
- Section 6.1.4, “http_server.ssl_trust_store,” on page 21
- Section 6.1.5, “http_server.use_digest,” on page 22
- Section 6.1.6, “owcimomd.ACL_superuser,” on page 22
- Section 6.1.7, “owcimomd.allowed_anonymous,” on page 23
- Section 6.1.8, “owcimomd.allowed_users,” on page 23
6.1.1 http_server.allow_local_authentication

Purpose

Directs the http_server to allow local authentication without supplying a password, relying on local
system file permissions.

You can use this setting with the Basic or Digest settings.

Syntax

http_server.allow_local_authentication = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Disable local authentication.</td>
</tr>
<tr>
<td>true</td>
<td>Enables local authentication.</td>
</tr>
<tr>
<td></td>
<td>This is the default setting for Linux.</td>
</tr>
</tbody>
</table>

Example

http_server.allow_local_authentication = true

6.1.2 http_server.digest_password_file

Purpose

Specifies a location for the password file. This is required if the http_server.use_digest setting is enabled.

Syntax

http_server.digest_password_file = path_filename

The default path and filename for the digest password file is /etc/openwbem/digest_auth.passwd.

Example

http_server.digest_password_file = /etc/openwbem/digest_auth.passwd
6.1.3 http_server.ssl_client_verification

**Purpose**

Determines whether the server should attempt to authenticate clients with SSL Client Certificate verification.

This setting is disabled by default.

**Syntax**

http_server.ssl_client_verification = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>autoupdate</td>
<td>Specifies the same functionality as the Optional option; however, previously unknown client certificates that pass HTTP authentication are added to a trust store so that subsequent client connections with the same certificate do not require HTTP authentication.</td>
</tr>
<tr>
<td>disabled</td>
<td>Disables client certificate checking. This is the default setting.</td>
</tr>
<tr>
<td>optional</td>
<td>Allows a trusted certificate to be authenticated (no HTTP authentication is necessary). Also allows an untrusted certificate to pass the SSL handshake if the client passes the HTTP authentication.</td>
</tr>
<tr>
<td>required</td>
<td>Requires a trusted certificate for the SSL handshake to succeed.</td>
</tr>
</tbody>
</table>

**Example**

http_server.ssl_client_verification = disabled

6.1.4 http_server.ssl_trust_store

**Purpose**

Specifies a directory containing the OpenSSL trust store.

**Syntax**

http_server.ssl_trust_store = path

The default path for the trust store file is /etc/openwbem/truststore.

**Example**

http_server.ssl_trust_store = /etc/openwbem/truststore
6.1.5 http_server.use_digest

**Purpose**

Directs the HTTP server to use Digest authentication, which bypasses the Basic authentication mechanism. To use Digest, you must set up the digest password file using `owdigestgenpass`.

Digest doesn’t use the authentication module specified by the OWCIMOMD.authentication_module configuration setting.

**Syntax**

```
http_server.use_digest = option
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Enables the Basic authentication mechanism. This is the default for OES 2 Linux.</td>
</tr>
<tr>
<td>true</td>
<td>Disables the Basic authentication mechanism. This is the default OpenWBEM setting.</td>
</tr>
</tbody>
</table>

**Example**

```
http_server.use_digest = false
```

6.1.6 owcimomd.ACL_superuser

**Purpose**

Specifies the user name of the user that has access to all Common Information Model (CIM) data in all namespaces maintained by the OWCIMOMD. This user can be used to administer the `/root/security` name space, which is where all ACL user rights are stored.

ACL processing is not enabled until the `OpenWBEM_Acl1.0.mof` file has been imported.

**Syntax**

```
owcimomd.ACL_superuser = username
```

**Example**

```
owcimomd.ACL_superuser = root
```
6.1.7 owcimomd.allowed_anonymous

Purpose
Enables or disables anonymous logins to owmgmt_openwebem_lx_nwd.

Syntax
owcimomd.allowed_anonymous = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Requires login with a user name and password to access OWCIMOMD data. This is the default and recommended setting.</td>
</tr>
<tr>
<td>true</td>
<td>Allows anonymous logins to OWCIMOMD.</td>
</tr>
<tr>
<td></td>
<td>This disables authentication. No user name or password is required to access OWCIMOMD data.</td>
</tr>
</tbody>
</table>

Example
owcimomd.allowed_anonymous = false

6.1.8 owcimomd.allowed_users

Purpose
Specifies a list of users who are allowed to access OWCIMOMD data.

Syntax
owcimomd.allowed_users = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Specifies one or more users who are allowed to access the OWCIMOMD data. Separate each user name with a space.</td>
</tr>
<tr>
<td>*</td>
<td>Allows all users to authenticate (for example, if you choose to control access with ACLs instead).</td>
</tr>
<tr>
<td></td>
<td>This option is enforced for all authentication methods unless owcimomd.allow_anonymous is set to true.</td>
</tr>
<tr>
<td></td>
<td>This is the default setting.</td>
</tr>
</tbody>
</table>

Example
owcimomd.allowed_users = bcwhitely jkcarey jlanderson
6.1.9 owcimomd.authentication_module

Purpose

Specifies the authentication module that is used by OWCIMOMD. This setting should be an absolute path to the shared library containing the authentication module.

Syntax

owcimomd.authentication_module = path_filename

The following are the default path and filename for the authentication modules:

<table>
<thead>
<tr>
<th>Platform</th>
<th>File Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux x86</td>
<td>/usr/lib/openwbem/authentication/libnovellauthentication.so</td>
</tr>
<tr>
<td>Linux 64</td>
<td>/usr/lib64/openwbem/authentication/libnovellauthentication.so</td>
</tr>
</tbody>
</table>

Example

owcimomd.authentication_module = /usr/lib/openwbem/authentication/libnovellauthentication.so

6.1.10 simple_auth.password_file

Purpose

Specifies the path to the password file when the simple authentication module is used. This setting is disabled by default.

Syntax

simple_auth.password_file = path_filename

Example

simple_auth.password_file = /etc/openwbem/simple_auth.passwd

6.2 Changing the Certificate Configuration

The http_server.SSL_cert and the http_server.SSL_key settings specify the location of the file or files that contains the host’s private key and the certificate that is used by OpenSSL for HTTPS communications.

The .pem file is located in the following default locations:
### Syntax

```plaintext
http_server.SSL_cert = path_filename

and

http_server.SSL_key = path_filename
```

### Example

```plaintext
http_server.SSL_cert = /etc/openwbem/servercert.pem

http_server.SSL_key = /etc/openwbem/serverkey.pem
```

### 6.3 Changing the Port Configuration

The `http_server.http_port` and `server.https_port` settings specify the port number that OWCIMOMD listens on for all HTTP and HTTPS communications.

#### Syntax

```plaintext
http_server.http_port = option

or

http_server.https_port = option
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
</table>
| **Specific_port_number** | Specify the specific port for HTTP or HTTPS communications.  
                          | For HTTP, the default port is 5988.  
                          | For HTTPS, the default port is 5989.  |
| -1           | Disables HTTP or HTTPS connections (for example, if you only want to support HTTPS connections).  |
| 0            | Dynamically assigns a port number at run time.                                        |

#### Example

These settings disable the HTTP port and enable port 5989 for HTTPS communications:

```plaintext
http_server.http_port = -1

http_server.https_port = 5989
```
6.4 Configuring CIMOM Daemons to Bind to IP Addresses

You can configure OpenWBEM to bind the CIMOM daemons to all of the IP addresses on a server.

You can do this by editing the /etc/openwbem/openwbem.conf file. Set the http_server.listen_addresses parameter of the openwbem.conf file to 0.0.0.0, which is the default. The following is the section to change in the openwbem.conf file:

```plaintext
# http_server.listen_addresses option specifies the local addresses
# to listen on. The option is a space delimited list.
# Each item is either a hostname or an IP address.
# The value 0.0.0.0 means to listen on all local addresses.
# This is a multi-valued option. Whitespace is the separator.
# The default is 0.0.0.0
http_server.listen_addresses = 0.0.0.0
```

6.5 Changing the Default Logging Configuration

The following log settings in the owcimomd.conf file let you specify where and how much logging occurs, the type of errors logged, and the log size, filename, and format:

- Section 6.5.1, “log.main.categories,” on page 26
- Section 6.5.2, “log.main.components,” on page 27
- Section 6.5.3, “log.main.format,” on page 28
- Section 6.5.4, “log.main.level,” on page 29
- Section 6.5.5, “log.main.location,” on page 30
- Section 6.5.6, “log.main.max_backup_index,” on page 30
- Section 6.5.7, “log.main.max_file_size,” on page 30
- Section 6.5.8, “log.main.type,” on page 31

If you want to set up debug logging, see Section 6.6, “Configuring Debug Logging,” on page 31.

If you want to set up additional logs, see Section 6.7, “Configuring Additional Logs,” on page 32.

6.5.1 log.main.categories

Purpose

Specifies the categories the log outputs.

Syntax

```
log.main.categories = option
```
Changing the OpenWBEM CIMOM Configuration

Example

log.main.categories = FATAL ERROR INFO

6.5.2 log.main.components

Purpose
Specifies the components that the log outputs.

Syntax

log.main.components = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>Specifies the components to be logged (such as OWCIMOMD) using a space-delimited list. Providers can use their own components.</td>
</tr>
<tr>
<td>*</td>
<td>Specifies that all components are logged. This is the default setting.</td>
</tr>
</tbody>
</table>

Example

log.main.components = owcimomd nssd
6.5.3 log.main.format

Purpose

Specifies the format (text mixed with printf() style conversion specifiers) of the log messages.

Syntax

log.main.format = conversion specifier

<table>
<thead>
<tr>
<th>Option</th>
<th>Specifies</th>
</tr>
</thead>
<tbody>
<tr>
<td>%%</td>
<td>%</td>
</tr>
<tr>
<td>%c</td>
<td>Component (such as OWCIMOMD)</td>
</tr>
<tr>
<td>%d</td>
<td>Date</td>
</tr>
<tr>
<td></td>
<td>Can be followed by a date format specifier enclosed between braces. For example, %d{%H:%M:%S} or %d %{d %b %Y %H:%M:%S}. If no date format specifier is given, then ISO 8601 format is assumed. The only addition is %Q, which is the number of milliseconds. For more information about the date format specifiers, see the documentation for the strftime() function found in the &lt;ctime&gt; header.</td>
</tr>
<tr>
<td>%e</td>
<td>Message as XML CDATA. This includes the &quot;&lt;![CDATA[&quot; and ending &quot;]]&gt;&quot;</td>
</tr>
<tr>
<td>%F</td>
<td>Filename</td>
</tr>
<tr>
<td>%l</td>
<td>Filename and line number. For example, file.cpp(100)</td>
</tr>
<tr>
<td>%L</td>
<td>Line number</td>
</tr>
<tr>
<td>%M</td>
<td>Method name where the logging request was issued (only works on C++ compilers that support <strong>PRETTY_FUNCTION</strong> or C99’s <strong>func</strong>).</td>
</tr>
<tr>
<td>%m</td>
<td>Message</td>
</tr>
<tr>
<td>%n</td>
<td>Platform-dependent line separator character (\n) or characters (\r\n).</td>
</tr>
<tr>
<td>%p</td>
<td>Category, also known as level or priority.</td>
</tr>
<tr>
<td>%r</td>
<td>Number of milliseconds elapsed between the start of the application and the creation of the logging event.</td>
</tr>
<tr>
<td>%t</td>
<td>Thread ID</td>
</tr>
<tr>
<td>\n</td>
<td>New line</td>
</tr>
<tr>
<td>\t</td>
<td>Tab</td>
</tr>
<tr>
<td>\r</td>
<td>Line feed</td>
</tr>
<tr>
<td>\ \</td>
<td></td>
</tr>
<tr>
<td>\x&lt;hexDigits&gt;</td>
<td>Character represented in hexadecimal</td>
</tr>
</tbody>
</table>

It is possible to change the minimum field width, the maximum field width, and justification. The optional format modifier is placed between the percent sign (%) and the conversion character. The first optional format modifier is the left justification flag, which is the minus (-) character. The
optional minimum field width modifier follows, which is an integer that represents the minimum number of characters to output. If the data item requires fewer characters, it is padded with spaces on either the left or the right, according to the justification flag. If the data item is larger than the minimum field width, the field is expanded to accommodate the data.

The maximum field width modifier is designated by a period (.) followed by a decimal constant. If the data item is longer than the maximum field, then the extra characters are removed from the beginning of the data item (by default) or from the end (if the left justification flag was specified).

**Examples**

Log4j TTCC layout:

```
"%r [%t] %-5p %c - %m"
```

Similar to TTCC but with some fixed-size fields:

```
"%-6r [%15.15t] %-5p %30.30c - %m"
```

XML output conforming to log4j.dtd 1.2, which can be processed by Chainsaw (if used, this must be on one line; it is split up here for readability):

```
<log4j:event logger="%c" timestamp="%d{%s%Q}" level="%p" thread="%t">
  <log4j:message>%e</log4j:message>
  <log4j:locationInfo class="" method="" file="%F" line="%L"/></log4j:event>
```

The following is the default:

```
log.main.format = [%t] %m
```

### 6.5.4 log.main.level

**Purpose**

Specifies the level the log outputs. If set, the log outputs all predefined categories at and above the specified level.

**Syntax**

```
log.main.level = option
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG</td>
<td>Logs all Debug, Info, Error, and Fatal error messages.</td>
</tr>
<tr>
<td>ERROR</td>
<td>Logs all Error and Fatal error messages.</td>
</tr>
<tr>
<td></td>
<td>This is the default setting.</td>
</tr>
<tr>
<td>FATAL</td>
<td>Logs only Fatal error messages.</td>
</tr>
<tr>
<td>INFO</td>
<td>Logs all Info, Error, and Fatal error messages.</td>
</tr>
</tbody>
</table>

**Example**

```
log.main.level = ERROR
```
6.5.5 log.main.location

Purpose
Specifies the location of the log file OWCIMOMD uses when the log.main.type setting option specifies that logging is sent to a file.

Syntax
log.main.location = path_filename

Example
log.main.location = /system/cimom/var/owcimomd.log

6.5.6 log.main.max_backup_index

Purpose
Specifies the amount of backup logs that are kept before the oldest is erased.

Syntax
log.main.backup_index = option

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned_integer_above_0</td>
<td>Specifies the number of backup logs kept.</td>
</tr>
<tr>
<td></td>
<td>The default setting is 1 log file.</td>
</tr>
<tr>
<td>0</td>
<td>No backup logs are made and the log is truncated when it reaches the maximum file size.</td>
</tr>
</tbody>
</table>

Example
log.main.max_backup_index = 1

6.5.7 log.main.max_file_size

Purpose
Specifies the maximum size (in KB) that the OWCIMOMD log can grow to.

Syntax
log.main.max_file_size = option
### 6.5.8 log.main.type

**Purpose**
Specifies the type of main log OWCIMOMD uses.

**Syntax**

$log\text{.main.type} = \text{option}$

<table>
<thead>
<tr>
<th>Option</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Sends all messages to a file that is identified in the log.main.location configuration setting.</td>
</tr>
<tr>
<td>null</td>
<td>Disables logging.</td>
</tr>
<tr>
<td>syslog</td>
<td>Sends all messages to the syslog interface.</td>
</tr>
<tr>
<td></td>
<td>This is the default setting for Linux.</td>
</tr>
</tbody>
</table>

**Example**

$log\text{.main.type} = \text{syslog}$

### 6.6 Configuring Debug Logging
If OWCIMOMD is run in debug mode, then the debug log is active with the following settings:

- $log\text{.debug.categories} = \ast$
- $log\text{.debug.components} = \ast$
- $log\text{.debug.format} = \%t \%m$
- $log\text{.debug.level} = \ast$
- $log\text{.debug.type} = \text{stderr}$
### 6.6.1 Debug Log with Color

If you want a color version of the debug log, use the following ASCII escape codes:

```plaintext
log.debug.format = \x1b[1;37;40m[\x1b[1;31;40m%-.6t\x1b[1;37;40m]\x1b[1;32;40m%m\x1b[0;37;40m
```

If you want to use additional colors, use the following codes with the `log.debug.format` command:

<table>
<thead>
<tr>
<th>Color</th>
<th>Codes</th>
</tr>
</thead>
<tbody>
<tr>
<td>red</td>
<td>\x1b[1;31;40m</td>
</tr>
<tr>
<td>dark red</td>
<td>\x1b[0;31;40m</td>
</tr>
<tr>
<td>green</td>
<td>\x1b[1;32;40m</td>
</tr>
<tr>
<td>dark green</td>
<td>\x1b[0;32;40m</td>
</tr>
<tr>
<td>yellow</td>
<td>\x1b[1;33;40m</td>
</tr>
<tr>
<td>dark yellow</td>
<td>\x1b[0;33;40m</td>
</tr>
<tr>
<td>blue</td>
<td>\x1b[1;34;40m</td>
</tr>
<tr>
<td>dark blue</td>
<td>\x1b[0;34;40m</td>
</tr>
<tr>
<td>purple</td>
<td>\x1b[1;35;40m</td>
</tr>
<tr>
<td>dark purple</td>
<td>\x1b[0;35;40m</td>
</tr>
<tr>
<td>cyan</td>
<td>\x1b[1;36;40m</td>
</tr>
<tr>
<td>dark cyan</td>
<td>\x1b[0;36;40m</td>
</tr>
<tr>
<td>white</td>
<td>\x1b[1;37;40m</td>
</tr>
<tr>
<td>dark white</td>
<td>\x1b[0;37;40m</td>
</tr>
<tr>
<td>gray</td>
<td>\x1b[0;37;40m</td>
</tr>
<tr>
<td>reset color</td>
<td>\x1b[0;37;40m</td>
</tr>
</tbody>
</table>

### 6.7 Configuring Additional Logs

If you want to create additional logs, list the log names under this setting:

```plaintext
owcimomd.additional_logs = logname
```

Separate multiple log names with spaces.

**Syntax**

```plaintext
owcimomd.additional_logs = logname
```

For each log, the following settings apply:

```plaintext
log.log_name.categories
```
log.log_name.components
log.log_name.format
log.log_name.level
log.log_name.location
log.log_name.max_backup_index
log.log_name.max_file_size

Example

owcimomd.additional_logs = errorlog1 errorlog2 errorlog3
7 Security Considerations

This section includes issues that you should consider when installing and configuring OpenWBEM services on a Novell Open Enterprise Server (OES) 2 Linux server.

- Section 7.1, “Secure Access,” on page 35
- Section 7.2, “CIM Providers,” on page 35

7.1 Secure Access

The default setup of OpenWBEM is relatively secure. However, you might want to review the following to ensure access to OpenWBEM components is as secure as desired for your organization. See “Ensuring Secure Access” on page 16.

7.2 CIM Providers

The OWCIMOMD process changes the fsuid (file system UID) of the threads as they execute provider code. However, these providers run in the same process space as OWCIMOMD, which runs as root. The fsuid change is done for convenience of the providers so that they can determine the access that a user has to the file system. This fsuid change provides only a minimal level of security. For security purposes, the providers should be considered as running as root.

**IMPORTANT:** Because CIM providers must run as root they should be monitored for attacks.

For example, look in syslog files to find odd patterns of behavior or malicious activity. In addition, if CIM or its providers do security logging, look at those log files as well.
A Documentation Updates

To help you keep current on updates to the documentation, this section contains information on content changes that have been made in this OES 2: OpenWBEM Services Administration Guide since the initial release of Open Enterprise Server 2.

The documentation was updated on the following dates:

- Section A.1, “April 30, 2013,” on page 37
- Section A.2, “January 31, 2013,” on page 37
- Section A.3, “December 2010 (OES 2 SP3),” on page 38
- Section A.4, “November 9, 2009 (OES 2 SP2),” on page 38
- Section A.5, “December 2008,” on page 38

A.1 April 30, 2013

Updates were made to the following section. The changes are explained below.

A.1.1 What’s New or Changed for Novell Cluster Services

<table>
<thead>
<tr>
<th>Location</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 2.1, “What’s New (April 2013 Patches),” on page 9</td>
<td>This section is new.</td>
</tr>
</tbody>
</table>

A.2 January 31, 2013

Updates were made to the following section. The changes are explained below.

A.2.1 What’s New or Changed for Novell Cluster Services

<table>
<thead>
<tr>
<th>Location</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 2.2, “What’s New (January 2013 Patches),” on page 9</td>
<td>This section is new.</td>
</tr>
</tbody>
</table>
A.3  December 2010 (OES 2 SP3)

This guide was updated to conform with Novell documentation standards. Information specific to the NetWare 6.5 SP8 operating system was removed. For NetWare openWBEM management information, see the NW 6.5 SP8: OpenWBEM Services Administration Guide.

A.4  November 9, 2009 (OES 2 SP2)

The guide What’s New section was updated for OES 2 SP2. There are no other content changes for OES 2 SP2.

A.5  December 2008

Updates were made to the following sections. The changes are explained below.

- Section A.5.1, “Changing the OpenWBEM CIMOM Configuration,” on page 38
- Section A.5.2, “What’s New for OpenWBEM,” on page 38

A.5.1  Changing the OpenWBEM CIMOM Configuration

<table>
<thead>
<tr>
<th>Location</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 6.4, “Configuring CIMOM Daemons to Bind to IP Addresses,” on page 26</td>
<td>This section is new.</td>
</tr>
</tbody>
</table>

A.5.2  What’s New for OpenWBEM

<table>
<thead>
<tr>
<th>Location</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 2.5, “OES 2 SP1,” on page 10</td>
<td>This section is new.</td>
</tr>
</tbody>
</table>
