

# PlateSpin® Recon: Workload Profiling, Analysis and Planning

Successful data center initiatives require considerable up-front planning and analysis to ensure a maximum return on investment. PlateSpin Recon is a sophisticated workload profiling, analysis and planning solution that provides new levels of intelligence, visual analysis and forecasting for optimizing the data center. PlateSpin Recon collects inventory and workload utilization statistics for a clear and concise picture of the application services running in the data center and how their resources are being used. With broad multiplatform support, PlateSpin Recon takes the guesswork out of complex server consolidation, disaster recovery, capacity planning and green data center initiatives.

PlateSpin Recon provides advanced scenario modeling, trending, forecasting and planning capabilities to take the guesswork out of data center initiatives. Use powerful what-if modeling to determine optimal combinations of hardware and virtual hosts to ensure maximum resource utilization.

- **Solution:**  
Workload Management
- **Capabilities:**  
Server Consolidation  
Consolidated Recovery  
Green Computing  
Data Center Optimization  
Capacity Profiling & Planning  
Workload Profiling  
Virtual Infrastructure Management
- **Product:**  
PlateSpin Recon

**PlateSpin Workload Management**  
PlateSpin Workload Management from Novell is a portfolio of enterprise-class products that simplify the management of server workloads across today's mixed IT environments. PlateSpin Workload Management profiles, migrates, protects and manages workloads over the network between multiple hypervisors and computing platforms – all from a single point of control. Engineered to fit into your existing IT infrastructure, our cohesive solution is designed to scale as your data center evolves. PlateSpin Workload Management allows enterprises of all sizes to reduce costs, complexity and risk, transforming their data center into a more agile, efficient and resilient IT environment.

# With PlateSpin Recon, you can rapidly collect inventory and utilization data across thousands of servers, plan initiatives based on concrete analysis and increase visibility into ongoing resource utilization.

“By using PlateSpin, we were able to get a picture of our current environment and the picture wasn’t exactly a pretty one. Equipped with irrefutable data and analysis on our sprawling and under-utilized infrastructure, we identified the need to completely rethink our data center. By investing wisely in server virtualization, we saw that we could dramatically reduce the cost of our annual server hardware refresh, as well as slash our power consumption, cooling costs and carbon emissions.”

**Richard Dawson**  
IT Services Manager  
Bracknell Forest Borough Council

## Optimize Your Data Center with Workload Profiling

PlateSpin Recon gives enterprises the ability to profile server workloads regardless of whether they reside on physical or virtual hosts. Previously, data center managers had to rely on best guesses to identify underutilized or under-protected servers and allocate sufficient resources for current and future needs. PlateSpin Recon provides the visibility and intelligence needed to plan successful data center initiatives and optimize server workloads.

## Increase Visibility Across Multiplatform Environments

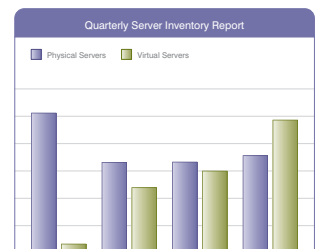

With broad support for Windows, UNIX and Linux platforms and scalability to accommodate even the world’s largest data centers, PlateSpin Recon provides a true enterprise-scale workload profiling, planning and monitoring solution. Data can be aggregated from multiple PlateSpin Recon data collectors for centralized data warehousing, analysis and planning to accommodate larger enterprises. When combined with PlateSpin Migrate, Novell’s multiplatform workload migration solution, organizations gain a complete end-to-end solution with tightly integrated planning and execution for data center initiatives.

## Improve the Speed and Quality of Data Center Initiatives

Virtualization initiatives cannot be undertaken without a thorough understanding of the server workloads running in the data center. PlateSpin Recon takes the guesswork out of complex server consolidation, disaster recovery, capacity planning and other data center initiatives by remotely discovering software and services inventory across the data center and analyzing key workload utilization metrics to develop optimal plans.

## Better Manage Your Virtual Infrastructure

Consolidating server workloads into a virtual infrastructure creates new challenges. Without effective management, virtual machines can rapidly proliferate, leading to poor resource utilization and an unwieldy infrastructure. In a virtualized IT environment, charging for shared IT resources is also more complicated. PlateSpin Recon helps enterprises make the most of their virtualization investments by profiling, managing and optimizing virtual environments and simplifying common management tasks such as IT chargeback reporting and virtual machine growth reporting.

PlateSpin Recon provides customizable graphical reporting to view and manage workloads and ongoing resource utilization. View summary workload sizing and power and cooling data or drill down to point-in-time granular levels using detailed tabular reports and time-series charts.

## Key Features of PlateSpin Recon

### Remote Data Collection

PlateSpin Recon remotely collects inventory and performance data with no need to physically touch data center servers. PlateSpin Recon's run-once inventory collector gathers comprehensive server inventory data while performance data is collected agentlessly via standard OS instrumentation capabilities. You can also import utilization data directly from your existing monitoring tools.

### Rich Data Modeling

Make better consolidation choices based on sophisticated analysis of resources, workloads and utilization trends. Tight integration with VMware VirtualCenter provides greater visibility into your virtual infrastructure, improving data center management and operations.

### Custom Report Creation and Delivery

Define resource and workload parameters and generate custom visual reports to accelerate data center assessments and server consolidations. Quickly identify consolidation candidates based on resource utilization trends and compare workload characteristics before and after consolidation. Scheduled report delivery via email or FTP ensures easy access to remote data and provides up-to-date information for decision making.

### Flexible Data Capture and Export

PlateSpin Recon data can be easily exported to a number of formats including HTML, PDF, Word, CSV, Excel or images for flexible report creation. Raw data can be extracted directly from the database and delivered to business intelligence applications for advanced statistical analysis.

### Enterprise-Level Scalability

Robust data collection, analysis and planning for all servers in the network puts PlateSpin Recon in a class all its own for large-scale data center consolidation projects. Data can be aggregated from multiple PlateSpin Recon data collectors for centralized data warehousing, analysis and planning or to accommodate larger implementations.

### Multiple Data Center Support

Distribute PlateSpin Recon to different geographical locations to remotely collect data and schedule updates to a master installation, enabling centralized analysis and planning for initiatives like server or data center consolidation.

### VM Growth Reporting

Run virtual machine growth reports to monitor the proliferation of virtual machines and avoid the administrative headaches associated with virtual machine sprawl.

### Flexible Chargeback Reporting

Because virtualization creates a pool of computing resources, it can be difficult to manage and monitor how virtual resources are being used and by whom. PlateSpin Recon allows organizations to effectively allocate and share virtual resources across various business units and departmental owners. PlateSpin Recon's flexible chargeback reporting capabilities improve virtual infrastructure management and financial accounting by allowing organizations to accurately calculate IT costs based on actual resource usage.

### Planning

Automatically generate server consolidation and disaster recovery plans based on detailed workload analysis to ensure the optimal fit between server workloads and virtual resources. The ability to use forecasted data ensures that plans are built to accommodate future growth.

### Workload Analysis

The PlateSpin Recon Capacity Planning Module automatically analyzes the five critical dimensions of workload – CPU, disk, memory, network and time – across thousands of servers simultaneously, providing consolidation plans that maximize utilization while minimizing resource contention.

### Scenario Modeling

Create custom scenarios with user-defined target server specifications including server templates or existing virtual machine servers to create an optimal consolidation plan.

### Power and Cooling Analysis

Compare and contrast potential power and cooling cost savings and ROI derived from different consolidation scenarios. Custom fields allow power and cooling requirements for major hardware platforms to be inputted and maintained in a central database, enabling organizations to analyze and cost-justify green computing initiatives.

### Time-Based Analysis

Stagger multiple workloads evenly across virtual hosts and account for hourly peaks and valleys inherent in server utilization trends.

### Workload and Utilization Forecasting

Predict future workloads and resource utilization based on historical trends to better plan for server consolidation and infrastructure growth, and enable more proactive systems management. Forecasting data on CPU, disk, memory and usage trends is presented in easy-to-read charts, reports and plans.
