

Novell iFolder®: Delivering the Data You Need, When You Need It

Still tied to hardware? Novell iFolder® frees you from hardware restrictions by providing a single, virtual work folder that you can access from any computer. No matter where you choose to work, iFolder does all the file management for you so you always know your files are secure, accessible and up to date. With iFolder, your business environment revolves around you—and your data remains just a click away—wherever you or your team members need to work.

Manage Files the Easy Way—Automatically

Novell iFolder is the easy way to synchronize, back up, share and access your files anywhere and anytime. Whether you are working on your office or home PC, a disconnected notebook or even at an Internet kiosk in an airport halfway around the world, your files are instantly available. Novell iFolder backs up your work immediately, so your files are always protected and easily recovered, even if your local data is lost. And later, when you move on to a different location and a different PC, your files are automatically updated to reflect the work you did elsewhere—with no e-mails to yourself, flash drives to lose or file transfers required.

Another outstanding example of innovation from Novell, iFolder simplifies complexity

and mitigates risk, so you can increase productivity enterprise-wide.

Simplify Complexity

- Access your files anywhere—on any computer—using a standard Web browser
- Update data across multiple workstations automatically
- Work while connected or disconnected, with automatic synchronization of file changes while online
- Access files through a familiar directory structure, no matter what computer you are using
- Eliminate complex login or VPN procedures—Internet access is all you need
- Easily and automatically share files with team members
- Keep bandwidth usage to a minimum by transmitting only the changes to a file, not the entire file

Mitigate Risk

- Automatically back up and store files on servers and multiple workstations to guard against localized data loss
- Encrypt sensitive files stored on the server to protect them from unauthorized access
- Centrally host and back up corporate data assets from local machines
- Use Internet standards to make file management part of your overall business strategy
- Eliminate pockets of data that are out of sync (so the view of data is the same on all machines)

What's New in Novell iFolder 3.6?

Novell iFolder is available as part of Novell® Open Enterprise Server 2. This version includes the following enhancements:

- Ability to share folders over the Internet
- Encryption of files stored on the iFolder server
- Fortified and simplified passphrase recovery
- Multi-server capability, with no limit on the number of users and servers
- Multi-domain capability, so a user can work with files belonging to two folders that reside on different iFolder domains
- Support for multiple directories (Novell eDirectory™, Active Directory*, OpenLDAP and Sun ONE*)

- Enhanced reporting for better manageability
- Orphan iFolder recovery through Web administration
- Multivolume management that allows administrators to easily add and delete volumes with the Web administrator console.

To make iFolder 3.6 more usable and deployable, the following features will be available (via a downloadable patch) to Novell Open Enterprise Server 2 customers approximately two months after its release:

- Support for both Windows Vista* (32- and 64-bit) and the Macintosh* client (Intel*).
- Server-side migration tools that help customers migrate seamlessly from a prior version to iFolder 3.6.
- Support for LDAP groups and group provisioning.
- Enhanced conflict resolution and policy management.
- Enhanced sharing management control.
- Improved web access and Web administration controls.
