

Course Introduction

With the introduction of Open Enterprise Server (OES), the file, print and Web services you know and love in NetWare are available on OES for Linux.

If you're already familiar with these services on NetWare, deploying and administering OES for Linux servers is easier than you think.

The *Bridging NetWare Skills to Open Enterprise Server for Linux* course will demystify the process and answer the question, *I know how to administer NetWare; how do I perform similar tasks on Linux?*

Course Structure

There are 10 modules that will guide you through the process of bridging your NetWare skills to Linux

- For best results, follow the modules in order at your own pace.

There are lab projects that provide practice of the information presented in the modules.

- The labs can be completed using lab hardware or virtual machine technology.
