

Management and Monitoring Services

Novell® ZENworks® 7 Server Management provides industry-standards-based monitoring, management, and reporting services for heterogeneous network environments, including support for multi-protocol LAN/WAN networks and servers.

In addition, the Management and Monitoring Services component helps you to pro-actively manage your Novell NetWare®, Windows and Linux servers by responding faster to network problems and increasing overall system availability.

Management and Monitoring Services has the following components:

- ♦ **Novell ConsoleOne®**, which provides the interface where you can manage and administer your network.
- ♦ **Management Site Services**, including:
 - ♦ Alarm Management
 - ♦ Database Administration
 - ♦ MIB Tools Administration
 - ♦ Monitoring Services
 - ♦ Network Discovery
 - ♦ Reporting
 - ♦ Role-Based Services
 - ♦ Topology Mapping
- ♦ **Server Management** for monitoring all the servers in your network.
- ♦ **Traffic Analysis** for monitoring all traffic on Ethernet, token ring, or Fiber Distributed Data Interface (FDDI) network segments.
- ♦ **Advanced Trending Agent** for monitoring.

The Management and Monitoring Services documentation contains the following sections:

- ♦ [Chapter 21, “Configuring Management and Monitoring Services,” on page 827](#)
- ♦ [Chapter 22, “Using Novell ConsoleOne with Management and Monitoring Services,” on page 855](#)
- ♦ [Chapter 23, “Understanding Network Discovery and Atlas Management,” on page 867](#)
- ♦ [Chapter 24, “Understanding Alarm Management,” on page 923](#)
- ♦ [Chapter 25, “Understanding Server Management,” on page 957](#)
- ♦ [Chapter 26, “Using the MIB Tools,” on page 999](#)
- ♦ [Chapter 27, “Using the Probe Manageability Tool,” on page 1021](#)
- ♦ [Chapter 28, “Monitoring Services,” on page 1025](#)
- ♦ [Chapter 29, “Understanding Traffic Analysis,” on page 1031](#)
- ♦ [Chapter 30, “Customizing the Agent Configuration,” on page 1121](#)

Configuring Management and Monitoring Services

To use Management and Monitoring Services effectively, you must correctly install and configure the components on your network. You should have already performed a basic installation of Novell® ZENworks® 7 Server Management (see “[Installation](#)” in the *Novell ZENworks 7 Server Management Installation Guide*).

The following sections provide you with the concepts and instructions to help you configure Management and Monitoring Services so that you can use its features to manage your network:

- ♦ [Section 21.1, “Understanding Management and Monitoring Services,”](#) on page 827
- ♦ [Section 21.2, “Planning the Configuration,”](#) on page 832
- ♦ [Section 21.3, “Role-Based Administration,”](#) on page 834
- ♦ [Section 21.4, “Configuring Management and Monitoring Services,”](#) on page 850

21.1 Understanding Management and Monitoring Services

This section provides information about the following components of the Management and Monitoring Services:

- ♦ [Section 21.1.1, “Management Site Services,”](#) on page 827
- ♦ [Section 21.1.2, “Server Management,”](#) on page 830
- ♦ [Section 21.1.3, “Traffic Analysis,”](#) on page 830
- ♦ [Section 21.1.4, “Novell ConsoleOne,”](#) on page 831

21.1.1 Management Site Services

The Management Site Services include the following:

- ♦ [“Network Discovery”](#) on page 828
- ♦ [“Database Administration”](#) on page 828
- ♦ [“Alarm Management”](#) on page 828
- ♦ [“Role-Based Services”](#) on page 828
- ♦ [“Reporting”](#) on page 829
- ♦ [“Topology Mapping”](#) on page 829
- ♦ [“Management Information Base \(MIB\) Tools Administration”](#) on page 830
- ♦ [“Monitoring Services”](#) on page 830

Network Discovery

When network auto discovery is started, the servers, routers, switches which are Simple Network Management Protocol (SNMP) instrumented, and the services hosted on these devices and workstations, are automatically discovered. The discovered data is written to a .dat file and displayed in the atlas map on Novell ConsoleOne®.

Maps reflect the scope of discovery set at the management server. By default, all devices that the management server is able to establish communication with, are discovered and stored at the management server. By defining the scope of NetExplorer™, you can limit the number of discovered objects.

For more detailed information on network discovery, see [Chapter 23, “Understanding Network Discovery and Atlas Management,”](#) on page 867.

Database Administration

Novell ZENworks Server Management provides a centralized Common Information Model (CIM)-compliant Sybase* database on the management server. The database serves as a repository for server and network data that can be displayed or formatted in various ways to provide you with the information you need to manage your network. The Server Management data is stored in a topology database containing three logical databases:

- ◆ Topology
- ◆ Alarms
- ◆ Map information

Most database functions are automatic and require very little administration. For more detailed information on Server Management databases, see [Chapter 32, “Novell ZENworks Management and Monitoring Services Database,”](#) on page 1149.

Alarm Management

Alarms recognized by Server Management include SNMP traps, connectivity testing, and threshold profiling. Alarm management processes traps and proprietary alarms and forwards the alarms to Novell ConsoleOne that subscribe to the alarms.

You can perform specific actions on an alarm by specifying the action in the alarm disposition. Some actions, like executing a program, sending an e-mail notification, and creating an archive, audible beep at the Console, and ticker messages, are automatically performed. You can set an action to forward specific processed alarms to other Server Management servers, as well as forward unprocessed SNMP traps directly to a target address of any third-party enterprise management application.

Role-Based Services

Management and Monitoring Services supports role-based administration and task management through Novell eDirectory™. Novell ZENworks Server Management uses Role-based Services to organize Management and Monitoring Services tasks into roles and to assign scope information to a role.

Role-based Services specify tasks that users are authorized to perform. Defining an Role-based Services includes creating an Role-based Services object and specifying the tasks that the role can perform.

For general information on creating Role-based Services objects or specifying tasks that Role-based Services can perform, see [“Configuring Role-Based Administration” on page 848](#).

For information on how Novell ZENworks Server Management implements role-based services, see [Section 21.3, “Role-Based Administration,” on page 834](#).

Reporting

Novell ZENworks Server Management provides reporting services to generate statistical information. These reports can be displayed on Novell ConsoleOne or exported to databases and Web formats. Server Management allows you to generate the following types of reports:

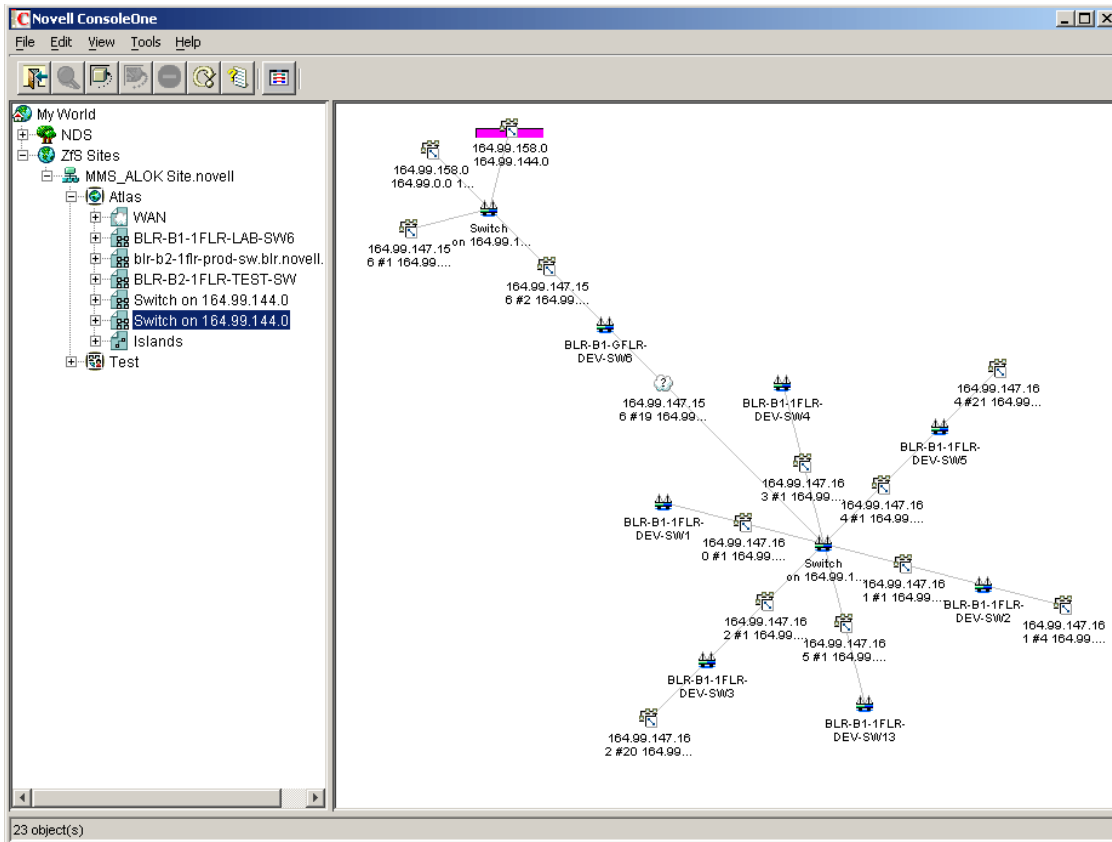

- ◆ Health reports
- ◆ Topology reports
- ◆ Alarm reports

For more detailed information on Management and Monitoring Services reports, see [“Using Reports in Management and Monitoring Services” on page 1151](#).

Topology Mapping

Topology mapping enables you to display maps in the Novell ZENworks Server Management hierarchical atlas as shown in [Figure 21-1](#). Maps reflect the scope of discovery set at the management server.

Figure 21-1 Novell ZENworks Server Management hierarchical atlas

For more detailed information on topology mapping, see [Section 23.3, “Managing the Atlas,”](#) on [page 913](#).

Management Information Base (MIB) Tools Administration

Novell ZENworks Server Management includes the MIB compiler and MIB browser, to manage SNMP devices.

The MIB tools enable you to:

- ◆ Set alarm templates for receiving SNMP traps
- ◆ Display and set values on SNMP devices
- ◆ Update trap definitions in the alarm template database
- ◆ Annotate third-party MIBs

For more detailed information on the MIB tools, see [Chapter 26, “Using the MIB Tools,”](#) on [page 999](#).

Monitoring Services

Monitoring, or SNMP, services include testing the connectivity and availability of a service on a network device. Novell ConsoleOne is notified whenever the status of the service changes. The services that can be monitored include DHCP, DNS, Echo, FTP, HTTP, HTTPS, IP, IPX™, NFS, NNTP, SMTP, SNMP, Time Service, TFTP, and WUser.

For more detailed information on monitoring services, see [Chapter 28, “Monitoring Services,”](#) on [page 1025](#).

21.1.2 Server Management

The server management component enables you to monitor all the servers in your network. This component must be installed on each of the servers you want to monitor using Novell ConsoleOne. During the Novell ZENworks Server Management installation you can select the servers to install the server management component.

You can deploy some or all of the server monitoring software components to meet your management needs best. For more detailed information on server management, see [“Understanding Server Management”](#) on [page 957](#).

21.1.3 Traffic Analysis

The traffic management component provides the traffic analysis services for a NetWare® or Windows* server, to monitor all traffic on an Ethernet, Fiber Distributed Data Interface (FDDI), or token ring network segments.

The traffic analysis services include:

- ◆ Standard and enterprise-specific RFC 1757 MIB descriptions for remote network monitoring
- ◆ Extensions added to Novell eDirectory, including Remote Monitor (RMON) agent configuration
- ◆ Network traffic trending and analysis tools

- ◆ Network health report templates
- ◆ Integration with topology maps
- ◆ Performance threshold configuration and profiling
- ◆ A view of conversations on network segment and utilization
- ◆ Packet capture tools and view

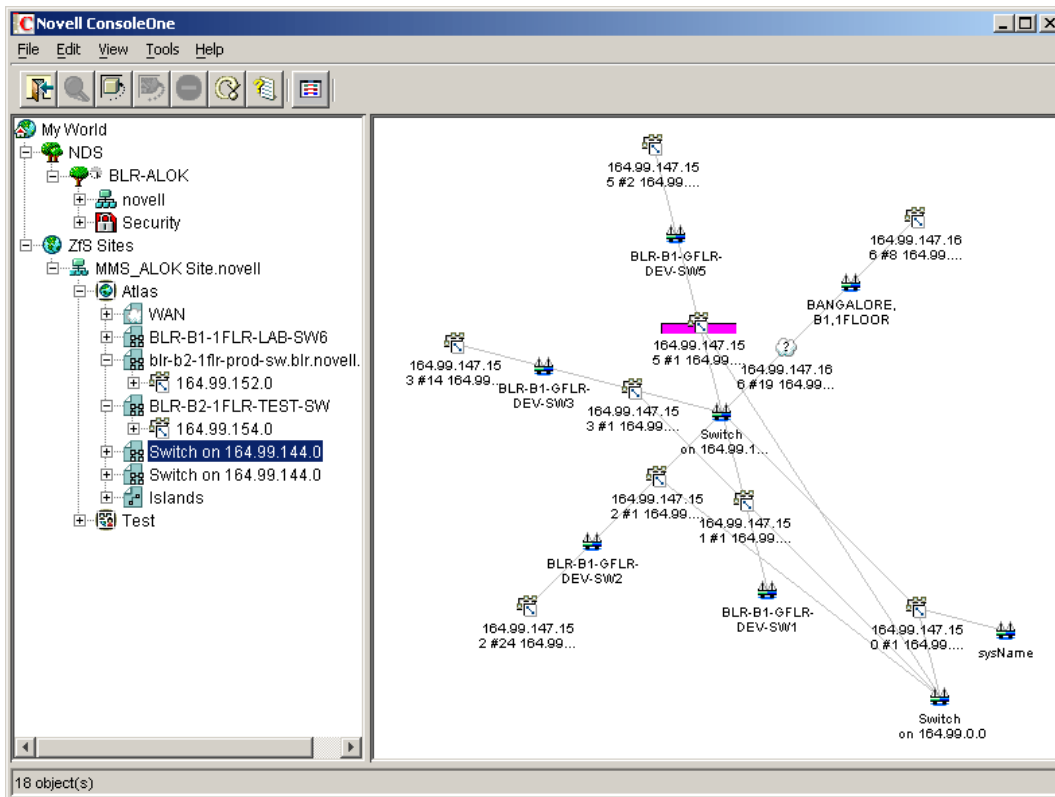

You can deploy some or all of the traffic analysis software components to meet your management needs best. For more detailed information on analyzing the network traffic, see [Chapter 29, “Understanding Traffic Analysis,”](#) on page 1031.

21.1.4 Novell ConsoleOne

The Novell ConsoleOne provides the interface where you can manage and administer your network. Novell ConsoleOne hosts programs (snap-ins) for integrating network administration and management snap-ins, enabling you to manage your network through a single interface.

ZENworks 7 Server Management provides a graphical user interface (GUI) snap-in to the Novell ConsoleOne under the Novell ZENworks Server Management namespace, as shown in [Figure 21-2](#). It provides access to the unique functions provided by Novell ZENworks Server Management.

Figure 21-2 Novell ZENworks Server Management Novell ConsoleOne under the Novell ZENworks Server Management Sites namespace

For more information on Novell ConsoleOne, see the [Novell ConsoleOne Web site \(http://www.novell.com/products/netconsole/consoleone\)](http://www.novell.com/products/netconsole/consoleone).

21.2 Planning the Configuration

This section discusses general planning options for configuring the Management Site Services and some of the Novell ZENworks Server Management agents (alarms, servers, and traffic) on your network. This section also discusses how to plan and implement role-based administration.

Before installing the Management and Monitoring Services software, you must decide what information you need to manage your network effectively. This section contains the following topics to help you decide the kind of information you would need to manage your network.

This section also explains how to configure the Management and Monitoring Services.

- ♦ [Section 21.2.1, “Defining Management Information Needs,” on page 832](#)
- ♦ [Section 21.2.2, “Planning a Strategy to Manage Your Network,” on page 832](#)

This guide also contains specific information on planning server management and segment monitoring in the following sections:

- ♦ [Section 25.2, “Planning for Server Management,” on page 960](#)
- ♦ [Section 29.2, “Planning for Segment Monitoring,” on page 1045](#)

21.2.1 Defining Management Information Needs

Novell ZENworks Server Management is flexible to suit the business needs of different network configurations. You need to understand what information is needed by the groups in your organization and suitably deploy the software to meet those needs.

Typically, the groups in your company may consist of front-line help desk people, back-end information system administrators, and management-level coordinators, who need specific information for planning, budgeting, troubleshooting, and other issues.

For instance, one group might have a set of critical servers that need to be monitored round the clock. You might want real-time monitoring of these servers and receive notification when serious faults occur on these servers. Another example could be a need to generate weekly reports on server trends for a group of defined servers.

21.2.2 Planning a Strategy to Manage Your Network

In order for Novell ZENworks Server Management to monitor and manage devices on your network, it must actively poll your network segments and devices on your network. Novell ZENworks Server Management performs polling of these network objects using standard protocols (SNMP, TCP/IP, and IPX).

The design of the Novell ZENworks Server Management components minimizes the impact on network performance by storing trending information on the servers hosting the SNMP and Remote Monitor (RMON) agents. Polling is directly performed by the management server based on requests coming from connected Novell ConsoleOne.

The Novell ZENworks Server Management system administrator should configure the polling frequency to provide an appropriate level of monitoring for the network environment. A good rule for setting appropriate levels of monitoring is to identify systems that are critical for the operation.

You can then group systems and segments into three basic management categories:

- ♦ **Mission critical:** Segments and devices that need to be actively monitored. Monitoring should be set at a high polling frequency.
- ♦ **Important:** Segments and devices that require less monitoring. These might be systems that host certain services that require a balance between polling overhead and performance. You should set the polling frequency to every few minutes, hours, or days.
- ♦ **Less important:** Segments and devices that require no active monitoring. Polling can be done on-demand to monitor segments and devices, or set to poll infrequently.

Devices that are either not polled or polled infrequently can be configured to send alarms (traps) to the management server to notify errors occurring on the system.

Configuring Your Network

The Management and Monitoring Services components rely on standard network protocols to communicate with devices on your network. In order to discover and accurately monitor your network and its devices, you need to ensure that the communication channels are consistent and well-configured.

The following sections discuss important aspects of your network configuration:

- ♦ [“IP Addressing Strategy” on page 833](#)
- ♦ [“IPX Transport Software” on page 833](#)
- ♦ [“Novell eDirectory and DNS Name Resolution” on page 833](#)
- ♦ [“SNMP Configuration” on page 834](#)

IP Addressing Strategy

If you want to discover devices communicating over IP, ensure that they are configured with a valid IP address to enable you to manage the devices. TCP/IP must be bound on the designated Novell ConsoleOne workstations and IP must be bound on the management server. You can use Dynamic Host Configuration Protocol (DHCP) addressing on Novell ConsoleOne workstation, but a static address must be assigned to the management server.

IPX Transport Software

All devices communicating over IPX that you want to discover and manage must be configured with an IPX/SPX - compatible transport network software stack. NetWare and Windows drivers are included with the operating system installation software. ZENworks Server Management is compatible with the Novell IP Compatibility Mode Driver.

Novell eDirectory and DNS Name Resolution

Verify that your NetWare and Windows servers and network device names are in place before you begin discovering your network. Name resolution can be in the form of local host files, an Novell eDirectory name, or a bindery table. The server names or hostnames are displayed in maps and configuration views rather than in IP or IPX addresses.

SNMP Configuration

The SNMP agents and RMON agents for NetWare and Windows servers and other SNMP-enabled network devices require a community string to be identified on the device. You need to configure each SNMP-enabled device with a community string and trap target destination that includes that Novell ZENworks Server Management server.

The community strings are used to ensure secure communication between the manager and the agents. In order for the Novell ZENworks Server Management system to communicate with an agent, the community string on the manager and agent must be similar and use the same port. In order to prevent all users from accessing information it is required to change the community string.

If the GET and SET community strings are changed from PUBLIC, you need to change settings at Novell ConsoleOne and on the management server (load NXPCON > SNMP > Add/Edit Community Name) to match the names on your network. For details on how to change the community string, after installing the Management Services, see [“Changing the SNMP Community String” on page 907](#).

For information on configuring the NetWare and Windows server agents, see [Chapter 29, “Understanding Traffic Analysis,” on page 1031](#).

21.3 Role-Based Administration

You can use Novell ConsoleOne, a directory-enabled framework for running Novell network administration utilities. The Novell ZENworks Server Management snap-ins to Novell ConsoleOne fully leverage Novell eDirectory to enable role-based administration and higher levels of security. Through Novell eDirectory, users will be able to log in once and have access to the management components as specified by their roles within their specific scope.

The Server Management snap-ins to Novell ConsoleOne allows you to divide the task of network administration amongst administrators. With Novell ConsoleOne, the functions and tasks of Server Management are organized into different, customized “views” based on each administrator's role in your organization.

The following sections discuss role-based administration:

- ◆ [Section 21.3.1, “Novell ZENworks Management Site,” on page 834](#)
- ◆ [Section 21.3.2, “General Novell ZENworks Server Management Roles,” on page 836](#)
- ◆ [Section 21.3.3, “Novell ZENworks Server Management Role-Based Modules and Roles,” on page 837](#)
- ◆ [Section 21.3.4, “Configuring Role-Based Administration,” on page 848](#)

21.3.1 Novell ZENworks Management Site

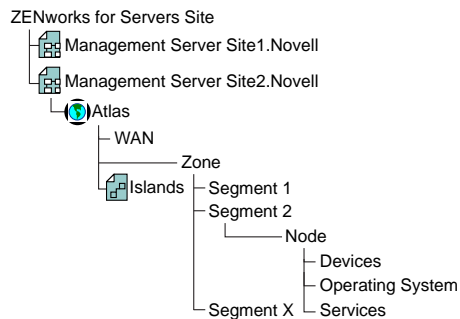

The Novell ZENworks management site sets boundaries for accessing object data on the management server through the role-based services. You can create roles and tasks and further define the level of access to network objects and information from the network container space.

When you install Management and Monitoring Services, a management site, a system administrator role (Role-based Services Admin), and all the site objects are created in Novell eDirectory. A management site defines the scope of objects (networks, segments, routers, bridges, switches, servers, workstations, and so on) discovered on your network. You can create a single site or multiple sites, depending on the size of your network or network management requirements.

A management site could include a single local network configuration or could encompass your entire network. The boundaries of a site are defined by the scope of network discovery. By default, network discovery is set to discover all connected networks and network nodes. The site object is created in the same context as the server object.

During installation, the default management site that is created is shown in [Figure 21-3](#). A single administration role is established with rights and permissions to all configuration and management tasks in the management system.

Figure 21-3 ZENworks Server Management site

Some default roles that monitor network traffic, handle alarms, and manage server systems, are available and allow you to add users. You can also use them as examples for your new role creations.

In the Server Management role-based services (Role-based Services), permissions that are required to access network objects, configurations, and information are associated with roles. Novell eDirectory User objects can be assigned to appropriate roles. The levels of abstractions in a role are described below:

- ♦ Roles - Created to perform various network management functions in your organization. You can simplify granting of permissions and restrict access to management tools and data by creating appropriate roles.
- ♦ Tasks - Actions performed to utilize components of the management system based on the specific responsibilities.
- ♦ Component/module - A software tool that provides a network management function. Server Management includes components for managing servers, monitoring segment traffic, and providing common services such as database management, alarm handling, and report generation.

The users added to a role, however, retain the access rights, permissions, and policies granted through the Novell eDirectory user account. For example, a user may be granted permission to access and configure a server through Novell eDirectory, but may not be granted permission to manage the server through the Role-based Services in Server Management. Therefore the management role that the user is assigned has limited access to the management services or components/modules in the Novell ZENworks Server Management system.

21.3.2 General Novell ZENworks Server Management Roles

Novell ZENworks Server Management components support role-based services (Role-based Services) and task management through Novell eDirectory. Server Management uses Role-based Services to organize Novell ZENworks Server Management tasks into roles and to assign scope information to a role, user or a group.

Role-based Services roles specify the tasks that users are authorized to perform. Defining an Role-based Services role includes creating an Role-based Services role object and specifying the tasks that the role can perform.

The tasks that Role-based Services roles can perform are displayed as Role-based Services Task objects in your Novell eDirectory tree. These objects are organized into one or more Role-based Services modules, which are containers that correspond to the different Server Management components. As shown in [Figure 21-4](#), Novell ZENworks Server Management provides predefined modules and Role-based Services role objects.

IMPORTANT: You cannot create new modules or tasks. You have to select from the pre-defined modules and tasks that are available.

Figure 21-4 Predefined ZENworks Server Management modules and Role-based Services role objects

You can create any role using the modules and tasks. Each module can have one or more tasks. For example, Role-based Services defines the task for Monitoring Services as Enable Remote Ping. If this task is assigned to your role, you can use the Monitoring Services facility. For a list of the predefined Novell ZENworks Server Management modules and roles along with the associated tasks, see [“Novell ZENworks Server Management Role-Based Modules and Roles” on page 837](#).

For more information on creating role objects using tasks and modules, see [“Configuring Role-Based Administration” on page 848](#).

21.3.3 Novell ZENworks Server Management Role-Based Modules and Roles

This section provides the following tables:

- ◆ [Table 21-1 on page 837](#)
- ◆ [Table 21-2 on page 840](#)

The following table lists each Novell ZENworks Server Management Role-based Services module and the tasks that can be performed for the module.

Table 21-1 *ZENworks Server Management Role-based Services module and its associated tasks*

Novell ZENworks Server Management Role-based Services Module	Associated Tasks

21.3.4 Configuring Role-Based Administration

Defining an Role-based Services role includes creating an Role-based Services role object and specifying the tasks that the role can perform.

The following sections discuss how to configure Role- Based Administration:

- ◆ “Defining Role-based Services Role” on page 848
- ◆ “Creating an External Scope” on page 849
- ◆ “Configuring a Scope Object” on page 849
- ◆ “Assigning Role-based Services Role Membership and Scope” on page 849

Defining Role-based Services Role

Role-based Services roles specify the tasks that users are authorized to perform in specific administration applications. Defining an Role-based Services role includes the following sections:

- ◆ “Creating an Role-based Services Role Object” on page 848
- ◆ “Specifying the Tasks that Role-based Services Roles Can Perform” on page 849

Creating an Role-based Services Role Object

To create an Role-based Services role object:

- 1 In Novell ConsoleOne, right-click the container that you want to create the Role-based Services role object, then click *New > Object*.
- 2 In *Class*, select *Role-based Services:Role*, then click *OK*.
- 3 Enter a name for the new Role-based Services role object.

Ensure to follow proper Novell eDirectory naming conventions. For Novell eDirectory naming conventions see [Novell eDirectory Administration Guide \(http://novell.com/documentation\)](http://novell.com/documentation).

Example: Password Administrator Role.

- 4 Click *OK*.

Specifying the Tasks that Role-based Services Roles Can Perform

To specify the tasks:

- 1 In Novell ConsoleOne, right-click an Role-based Services role, then click *Properties*.
Role-based Services task objects are located only in Role-based Services module containers
- 2 In the *Role Based Services* tab, make the associations you want.
- 3 Select the *Role Content* page, then add the list of tasks that the role can perform.
- 4 Click *OK*.

Creating an External Scope

To create an external scope:

- 1 In Novell ConsoleOne, right-click the container that you want to create the scope object, then click *New > Object*.
- 2 In *Class*, select *MW:Scope*, then click *OK*.
- 3 Enter a name for the new *MW:Scope* object.
Ensure to follow proper Novell eDirectory naming conventions. For Novell eDirectory naming conventions see [Novell eDirectory Administration Guide \(http://novell.com/documentation\)](http://novell.com/documentation).
Example: Password Administrator Role.
- 4 Click *OK*.

Configuring a Scope Object

To configure a scope object:

- 1 In Novell ConsoleOne, right-click the scope object, then click *Properties*.
- 2 Browse the site object to which the scope is associated.
- 3 In the Site scope, browse to select the computers to the site scope.
- 4 In the SQL script, specify the scope by selecting the object and the operator from the drop-down list.
- 5 Click *OK*.

IMPORTANT: By default the scope object will have all-site access.

The effective scope will be a union of Site scope and the objects specified in SQL script.

Assigning Role-based Services Role Membership and Scope

To assign an Role-based Services role and scope to a user:

- 1 In Novell ConsoleOne, right-click the user object to which you want to assign the role and scope, then click *Properties*.
- 2 Click *Role Based Services* tab, then click *Assigned Roles*.

- 3 Click *Add* to add the required role to the user.
- 4 Click *Scope* to add the scope for the user.
- 5 Click *OK*.

IMPORTANT: If a user is assigned two different roles with different scopes, the user has rights to all the tasks (union of tasks in role1 and tasks in role2) irrespective of the scopes.

You cannot assign role and scope to User groups and Organization Unit.

21.4 Configuring Management and Monitoring Services

Novell ZENworks Server Management is made up of several components, some of which require certain setup tasks before you can use them, and others that do not.

The following components do not require any specific setup tasks:

- ♦ Novell ZENworks Server Management databases
- ♦ Role-based services (Role-based Services)
- ♦ Management Information Base (MIB) tools
- ♦ Novell ConsoleOne
- ♦ Reporting
- ♦ SNMP services

The following sections describe the setup tasks that are required to get the following components up and running:

- ♦ [Section 21.4.1, “Stopping and Starting Management and Monitoring Services,” on page 850](#)
- ♦ [Section 21.4.2, “Setting Up Discovery and Starting Back-End Processes,” on page 851](#)
- ♦ [Section 21.4.3, “Setting Up the Alarm Management System,” on page 852](#)
- ♦ [Section 21.4.4, “Setting Up Monitoring,” on page 852](#)
- ♦ [Section 21.4.5, “Setting Up the Traffic Analysis Agent,” on page 853](#)

21.4.1 Stopping and Starting Management and Monitoring Services

If you need to install other software or perform other maintenance functions on your server, you can stop Management and Monitoring Services and down the server. After performing the maintenance, you must reboot the server and restart the services in order for the server to resume its Management and Monitoring Services.

To stop and start Management and Monitoring Services, complete the following steps at the management server console prompt:

- 1 To stop and unload Management and Monitoring Services, enter `stopmms`.
- 2 To stop all JAVA processes, enter `java -kill`.
- 3 To exit JAVA, enter `java -exit`.

- 4 To restart the server, enter `restart server`.
To down the server, enter `down server`. You need to start the server again.
- 5 To stop and unload all management and monitoring services and naming service, enter `stopmms -n`

Because the appropriate commands to start the back-end and discovery processes (SLOADER and NETEXPLOR) were inserted in the `autoexec.ncf` file when you installed Management and Monitoring Services, restarting the server will start these processes. If you modified the `autoexec.ncf` file and need to manually start these processes, see [“Manually Starting Discovery and Back-End Processes” on page 852](#).

21.4.2 Setting Up Discovery and Starting Back-End Processes

The discovery software on the management server automatically discovers the nodes on your network. Network nodes include servers, desktops, routers, switches, and any other network devices. Discovery starts automatically when the Novell ZENworks Server Management software is loaded on the management server and runs continually, 24 hours a day. The amount of time to build a complete database depends on the size of your network. Very small networks might take one or two hours; very large networks (several thousand nodes) might require several days.

It is recommended that you run Network discovery on a standalone as the discovery process consumes a longer duration if you use the system.

After installation, your servers are in one of the following states:

- ♦ Discovery and back-end services are running.

If you choose to start the auto discovery process and back-end services during installation, discovery is running on your Novell ZENworks Server Management server and your network is continually being discovered. You do not need to do anything further with regards to configuring discovery unless you want to modify your discovery parameters after you check the results of the initial discovery. For instructions on checking the results of discovery and modifying your discovery parameters, see [Chapter 23, “Understanding Network Discovery and Atlas Management,” on page 867](#).

IMPORTANT: After modifying any discovery parameters, you must restart the server as described in [“Stopping and Starting Management and Monitoring Services” on page 850](#).

- ♦ Discovery and back-end services are not running.

If you selected No, and did not start the auto discovery process and back-end services during installation, you must start discovery after you modify the default discovery parameters. For specific instructions on modifying discovery parameters, see [Chapter 23, “Understanding Network Discovery and Atlas Management,” on page 867](#).

Before discovering your network, you can modify the following discovery parameters:

- ♦ SNMP Community Strings. Ensure that discovery is configured with the community strings of your devices.

- ◆ **Discovery Scope.** By default, discovery will discover the entire network if correct community strings are provided. If the discovery scope needs to be limited for some reason, it can be modified.
- ◆ **IPX Discovery.** IPX discovery will take place as long as the Novell ZENworks Server Management server has a valid IPX address binding. If there is no IPX address bound to the Server Management server, but there are IPX networks that need to be discovered, install the NetWare server in CMD mode (load SCMD).

IMPORTANT: After modifying any discovery parameters, you must restart the services as described in [“Stopping and Starting Management and Monitoring Services” on page 850](#). If you never started discovery or the back-end services, you can manually start the services as described in [“Manually Starting Discovery and Back-End Processes” on page 852](#).

Manually Starting Discovery and Back-End Processes

The commands to start auto discovery and load the back-end services are inserted into the `autoexec.ncf` file by the installation program. Restarting the server will automatically start these processes. However, if you remove these commands you will need to manually start auto discovery and load the back-end services (management site services).

During installation, a search path is added to the `autoexec.ncf` file to the management server program file path — `Novell ZENworks\mms\mwserver\bin`

Enter `startmms.ncf` at the server to start the discovery and backend process.

The server will accept requests from Novell ConsoleOne only after the backend processes have been completely loaded.

21.4.3 Setting Up the Alarm Management System

The Novell ZENworks Server Management Alarm Management System can receive SNMP traps from any SNMP-enabled device or computer hosting a proxy SNMP agent. If your network device is using Management Agent for NetWare, Management Agent for Windows, Traffic Analysis Agent for NetWare, or Traffic Analysis Agent for Windows software, the device is discovered automatically for you. No setup is needed after installing the software.

Third-party SNMP agents require some setup before traps can be received. For information on setting up third-party SNMP agents, see [“SNMP Configuration” on page 834](#).

21.4.4 Setting Up Monitoring

Because the Management Agent for NetWare and the ManageWise[®] Agent for Windows are based on SNMP, all actions that are directed from network management console to a server involve SNMP SET and GET requests from the manager to the agent. Any Novell ConsoleOne requesting data from a managed server does so by issuing an SNMP GET request. An SNMP SET command is required to set server alarm thresholds or configuration parameters. Conducting these management operations from Novell ConsoleOne such as Novell ConsoleOne, raises the issue of ensuring security. In particular, unauthorized users setting configuration parameters on a server could cause performance problems or even sabotage network operations.

For these reasons, you should secure communication between the management system and your SNMP agents. For further information on SNMP security, [“SNMP Configuration” on page 834](#).

21.4.5 Setting Up the Traffic Analysis Agent

The Traffic Analysis Agent for NetWare is a distributed network analyzer that complements Novell ZENworks Server Management. While other Novell ZENworks Server Management agents collect data about specific network nodes, such as servers, the Traffic Analysis Agent for NetWare observes the interaction among these nodes on a specific LAN segment.

The agent is installed on a NetWare server. To set up Traffic Analysis Agent for NetWare, see [“Starting the Traffic Analysis Agent for NetWare” on page 853](#).

The Traffic Analysis Agent for Windows uses SNMP to communicate with the management server. After installation, in order for the Traffic Analysis Agent for Windows to operate, you must start the SNMP services. To start SNMP services, complete [“Starting the SNMP Service for the Traffic Analysis Agent for Windows” on page 853](#).

After the agents are set up, you must restart the Windows server on which the agent resides.

Starting the Traffic Analysis Agent for NetWare

The installation program for the Traffic Analysis Agent for NetWare modifies the `autoexec.ncf` file so that the agent starts automatically. Therefore, you do not need any further configuration. If, however, you are upgrading from a previous version of the Traffic Analysis Agent (referred to as the Traffic Analysis agent), and did not uninstall the previous version, you must ensure that each server on which you upgraded the agent will run the new Traffic Analysis Agent.

To ensure that the upgraded NetWare servers run the new Traffic Analysis Agent:

- 1 On each NetWare server where you upgraded the Novell ZENworks Server Management Traffic Analysis Agent, open the `autoexec.ncf` file located in `sys:\system`.
- 2 Comment out the following lines by placing a `#` character at the beginning of the line as follows:

```
#Search add lanzdir
#LANZ.NCF
```

The first statement defines the search path where `lanzdir` is the directory in which the older agent is installed. The second statement loads the older agent.

- 3 Save the file and restart the server.

The new agent will load and run automatically. The `lanz.ncf` file in the `agentinstallfolder\lanz` will start the Traffic Analysis agent. The `ulanz.ncf` in the same folder will stop the Traffic Analysis agent.

Starting the SNMP Service for the Traffic Analysis Agent for Windows

If you have configured Windows to start the SNMP service automatically, the agent installed on Windows starts with the SNMP service when you start Windows.

If you have not configured Windows to start the SNMP service automatically, do either of the following:

- ◆ At the command prompt, enter `net start snmp`.

- ♦ On Windows 2000/2003: In the Windows Control Panel, double-click *Administrative Tools > Services*, select *SNMP* from the list of services, then click *Start*.
When the SNMP service is started, the Traffic Analysis Agent for Windows will also start.

Using Novell ConsoleOne with Management and Monitoring Services

The Novell® ZENworks® Server Management console is a snap-in to the Novell ConsoleOne® management tool. Novell ZENworks Server Management expands Novell ConsoleOne management capabilities by adding menu options, property pages for existing Novell eDirectory™ objects, and ways to browse and organize network resources. This section introduces Novell ConsoleOne features that are unique to Server Management, including:

- ♦ [Section 22.1, “Navigating the Novell ZENworks Server Management Namespace,” on page 855](#)
- ♦ [Section 22.2, “Selecting Novell ZENworks Server Management Options,” on page 857](#)
- ♦ [Section 22.3, “Working with Views,” on page 859](#)

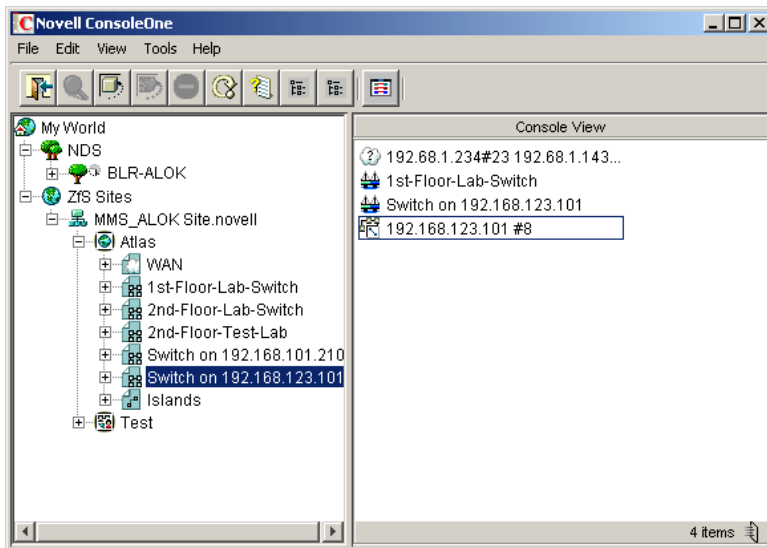

For more information on basic Novell ConsoleOne capabilities, see the [Novell ConsoleOne Administration Guide \(http://novell.com/documentation\)](http://novell.com/documentation).

22.1 Navigating the Novell ZENworks Server Management Namespace

In Novell ConsoleOne, your network and its resources are regarded as a set of objects and are arranged in various containers. Each top-level object is referred to as a namespace. To view your network and its resources on Novell ConsoleOne, you must log in to the Novell eDirectory tree which contains Management Site Server object.

The Novell ZENworks Server Management Novell ConsoleOne snaps in to Novell ConsoleOne under the Novell ZENworks Server Management Sites namespace, as shown in [Figure 22-1](#):

Figure 22-1 ZENworks Server Management ConsoleOne snap-ins

In general, you can perform administration tasks by browsing to an object in the left frame, right-clicking it, and clicking an option. Objects within the Novell ZENworks Server Management namespace are arranged in the following hierarchy:

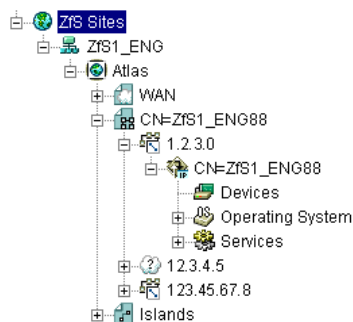

1. **Novell ZENworks Server Management sites object:** This is the Novell ZENworks Server Management namespace container. It is the top of the Novell ZENworks Server Management namespace hierarchy. Expand this object to display a list of Server Management management sites.
2. **Management Site:** This object represents a Novell ZENworks management server. It represents an Novell eDirectory object that defines a collection of discovered objects that collectively make up a group of services. Expand this object to display the atlas for the site.
3. **Atlas:** This is the container object for all discovered topology objects. The atlas can contain the following types of pages:
 - ◆ **WAN page:** Summarizes the entire network.
 - ◆ **Area page:** Displays segments on the network. There may be more than one Area page, depending on how your network is organized.
 - ◆ **Islands page:** Displays segments with undetermined connectivity.
4. **Segments:** Within each atlas page is a listing of the segment objects that are included in that section of the atlas.
5. **Nodes:** Within each segment object is a listing of server and node objects that reside on the segment. The icon displayed varies by the node type.
6. **Node Details:** Expand a node object to display a list of system internal components. Server data is grouped into the following three categories:
 - ◆ **Devices**

- ◆  Operating System
- ◆  Services

You can drill down into the server configuration further by clicking the plus signs next to the Devices, Operating System, and Services objects to display details about the internal components of the server. The internal components include the processors, installed software, volumes, kernel, and adapters associated with the server. For more details about the node objects, see [“Object Hierarchy” on page 978](#).

Figure 22-2 illustrates the Novell ZENworks Server Management namespace hierarchy:

Figure 22-2 ZENworks Server Management namespace hierarchy

22.2 Selecting Novell ZENworks Server Management Options

To display the Novell ZENworks Server Management options, you want to monitor or manage in the left frame, right-click the object. The options available are displayed. Novell ZENworks Server Management provides three main options:

- ◆ [Section 22.2.1, “Views,” on page 857](#)
- ◆ [Section 22.2.2, “Properties,” on page 858](#)
- ◆ [Section 22.2.3, “Actions,” on page 858](#)

22.2.1 Views

Views are different ways of displaying information. Novell ZENworks Server Management provides a variety of views designed to help you view the information of your network in different ways. The views Server Management provides are:

- ◆ **Atlas:** Provides a graphical representation of the discovered network topology, the physical location of nodes, node configuration, and alarm information.
- ◆ **Console:** Displays the objects contained in the selected container object. This view is useful while navigating the Novell ZENworks Server Management site.
- ◆ **Trend:** Provides a graphical representation of current and historical trend data by hour, day, week, month, or year. Monitoring trend data helps you with tasks such as determining which server is being used, who is using the server, troubleshooting problems, balancing load across multiple servers, and planning resources.

- ◆ **Active Alarms:** Provides a tabular display of alarm statistics for all the current alarms received from segments or devices, per management site. This view is refreshed whenever a new alarm occurs on the network.
- ◆ **Alarm History:** Provides a tabular display of all archived alarms, including the handled status of each alarm. This view is refreshed whenever a new alarm occurs on the network.
- ◆ **Alarm Summary:** Provides a graphical representation of the summary of alarms you have received. The view is divided into three panels of representation: pie chart panel, bar graph pane, and trend panel. Provides a tabular display of all archived alarms, including the handled status of each alarm.
- ◆ **Summary:** Provides a tabular information about the selected object's configuration. For example, the summary view for a server object displays information about NetWare Loadable Module™ files, memory usage, adapters, network interfaces, disks and disk controllers, volumes, queues, users, connections, open files, alarms, and installed software.

In addition to these main views, Novell ZENworks Server Management provides additional views for many of the objects in the hierarchy. For example, if you select a memory object, you can select a disk cache view that displays utilization for disk cache memory. For more information on the available views and the specific information displayed in an object view, see [“Object View Details” on page 979](#).

22.2.2 Properties

The Novell ZENworks Server Management Novell ConsoleOne provides several property pages that allow you to control Novell ZENworks Server Management-specific settings. To access the Novell ZENworks Server Management property pages, right-click an object and then click Properties.

- ◆ At the site level, Novell ZENworks Server Management provides property pages that allow you to edit global properties like Alarm Dispositions, Novell ZENworks Server Management Database settings, Simple Network Management Protocol (SNMP) settings, Management Information Base (MIB) Pool entries, and health report profiles.
- ◆ At the server level, Novell ZENworks Server Management provides property pages that allow you to modify SNMP settings.

For general information on using Novell ConsoleOne property pages, see the [Novell ConsoleOne Administration Guide \(http://novell.com/documentation\)](http://novell.com/documentation).

22.2.3 Actions

You can perform one or more actions on some objects. For example, if you right-click a server object, the *Actions* menu provides options for restarting or shutting down the server. However, if you right-click a volume object, the *Actions* menu provides options for mounting or dismounting the volume. For more information on performing actions on a managed object, see [“Executing Server Commands” on page 976](#).

22.3 Working with Views

Novell ZENworks Server Management Novell ConsoleOne provides two types of views: tabular (list) views and graphical views. The Console, Active Alarms, and Alarm History views are all tabular views. The atlas and Trend views are both graphical views. The Summary view may contain both tabular and graphical elements.

There are many characteristics that are common to all views. This section describes the common tasks you can perform on the Server Management views, including:

- ♦ [Section 22.3.1, “Changing the Appearance of a View,” on page 859](#)
- ♦ [Section 22.3.2, “Modifying Columns,” on page 860](#)
- ♦ [Section 22.3.3, “Filtering Views,” on page 861](#)
- ♦ [Section 22.3.4, “Sorting Views,” on page 862](#)
- ♦ [Section 22.3.5, “Printing a View,” on page 862](#)
- ♦ [Section 22.3.6, “Exporting a View,” on page 863](#)
- ♦ [Section 22.3.7, “Saving Views,” on page 863](#)
- ♦ [Section 22.3.8, “Deleting and Renaming Custom Views,” on page 864](#)
- ♦ [Section 22.3.9, “Displaying Multiple Views in Novell ConsoleOne Views,” on page 864](#)

22.3.1 Changing the Appearance of a View

In a view, you can change the following:

- ♦ [“Changing the Display Font” on page 859](#)
- ♦ [“Customizing Grid Lines” on page 859](#)
- ♦ [“Displaying the View Title” on page 860](#)

Changing the Display Font

To change the font of the text on a tabular view's headings or rows:

- 1 Click *View > Settings > Appearance*.
The Appearance dialog box is displayed.
- 2 To change the header or row font, click the appropriate button as follows:
 - ♦ To change the header font, click the *Header Font* button.
 - ♦ To change the row font, click the *Row Font* button.
 The Fonts dialog box is displayed.
- 3 Select the font options you want, then click *OK* to close the Fonts dialog box.
- 4 To save the changes made to the view, click *View > Saving > Save*.

Customizing Grid Lines

By default, the views displayed by Novell ZENworks Server Management do not contain grid lines. To display horizontal and/or vertical grid lines and to select a color for the grid lines:

- 1 Click *View > Settings > Appearance*.

The Appearance dialog box is displayed.

- 2 Select the grid line style you want to use from the Style drop-down list. You can choose to have:

- ♦ No grid lines (default)
- ♦ Horizontal grid lines only
- ♦ Vertical grid lines only
- ♦ Vertical and horizontal lines

- 3 If you want to select a color for the grid lines, click the *Color* button.

The Color Chooser dialog box is displayed. This dialog box includes three tab pages — *Color Swatches*, *HSB*, or *RGB* — allowing three methods of color selection.

- 4 Select the color you want to use for the grid lines using one of the three tab pages, then click *OK* to close the Color Chooser dialog box.
- 5 Click *OK* to close the Appearance dialog box.
- 6 To save the changes made to the view, click *View > Saving > Save*.

Displaying the View Title

You may find it useful to display the view name at the top of the right frame to help you keep track of where you are within the Novell ZENworks Server Management Novell ConsoleOne.

To display the view title:

- 1 Click *View > Show View Title*.

22.3.2 Modifying Columns

In a tabular view, you can change the columns in the following ways:

- ♦ “Resizing Columns” on page 860
- ♦ “Adding and Removing Columns” on page 860
- ♦ “Changing the Column Order” on page 861

Resizing Columns

To resize a column:

- 1 Move the mouse pointer to the margin between the columns you want to adjust.
- 2 When the pointer changes to a sizing arrow, drag the column to the width you want.
- 3 To save the changes made to the view, click *View > Saving > Save*.

Adding and Removing Columns

To add or remove columns from a view:

- 1 Click *View > Settings > Column Selector*.
- 2 To add a column, select the column name from the *Available Fields* list, then click *Add*.
- 3 To remove a column, select the column name from the *Show These Fields in This Order* list, then click *Remove*.

- 4 Click *OK*.
- 5 To save the changes made to the view, click *View > Saving > Save*.

Changing the Column Order

To change the order in which columns are displayed:

- 1 Click *View > Settings > Column Selector*.
- 2 Select the column you want to move from the *Show These Fields in This Order* list, then click the *Move Up* or *Move Down* button to change the location of the column.
- 3 Click *OK*.
- 4 To save the changes made to the view, click *View > Saving > Save*.

22.3.3 Filtering Views

You can display the alarms in a tabular view based on filter conditions. The filter applies only to the current management session and clears after you exit Novell ConsoleOne.

You set up a filter by selecting a criteria from four drop-down lists or entering a criteria. You can either set up simple filters that require only one line, or complex filters composed of multiple lines or groups of lines. If you set up a filter using more than one line, you must also specify the logical relationship between the line and/or group of lines.

To set up a filter:

- 1 Go to the required view.
- 2 Click *View > Settings > Filter*.
- 3 Select the column by which you want to filter alarms from the first drop-down list.
- 4 Select an operator from the second drop-down list.

The operator defines the constraint value set to the column. You can specify any of the following values for the alarm display - equal to, not equal to, greater than, less than, greater than or equal to, less than or equal to, contain, or start with the value you select in the third drop-down list. The list of available operators depends on the selected column.
- 5 Select a value from the third drop-down list.
- 6 Specify how this filter statement relates to other statements you plan to define by selecting a value from the fourth drop-down list.
 - ♦ If this is the only filter statement or if it is the last statement in a group, select *End*.
 - ♦ If you want to add a line below the current filter statement, select *New Row*. A new line is added. You must define the logical relationship between the previous line and the new line. The alarms will be displayed based on the logical condition you have specified. Select *And* to satisfy both the filter conditions. Select *Or* to satisfy any one of the filter conditions for the alarm to be displayed.
 - ♦ If you want to add one or more lines that are unrelated to the preceding lines, select *New Group*. A new line is added. An additional drop-down list separates the new line from the preceding lines. Select a value from this drop-down list to indicate the relations between the filter statements. Select *And* if you want both the filter statements to be satisfied. Select *Or* if you want only one of the filter statements in one of the groups to be satisfied. Select *End* from the fourth drop-down list when you add a new group.

- 7 Click *OK* if you have finished defining filters.

The view is updated to display only those entries that meet the filter criteria you defined.

22.3.4 Sorting Views

Using the sorting feature to modify the order in which the entries in a tabular view. You can sort the entries in the following two ways:

- ♦ “[Sorting the View Using a Single Column](#)” on page 862
- ♦ “[Sorting the View Using Multiple Columns](#)” on page 862

For instructions on sorting alarms, see “[Sorting Alarms](#)” on page 931.

Sorting the View Using a Single Column

To sort the entries displayed in the view by a single column:

- 1 Double-click the column header for the column by which you want to sort the entries.
When you double-click the column header, the entries in the view are sorted by that column in descending order (the most recent entries first). To sort the entries by ascending order (oldest entries first), double-click the column header again.

Sorting the View Using Multiple Columns

To sort the view using multiple columns:

- 1 Click *View > Settings > Sort*.
- 2 Select the first column you want the entries sorted by from the *Sort Items By* field.
- 3 Select the appropriate radio button to indicate whether you want the entries sorted in ascending or descending order.
- 4 Select the second column by which you want entries sorted from the *Then By* field, then click the *Ascending* or *Descending* radio button to specify the sort order.
- 5 Repeat [Step 4](#) for each subsequent column for which you want entries sorted.
- 6 Click *OK*.

The entries are now sorted according to the criteria you specified.

22.3.5 Printing a View

To print a view:

- 1 Go to the view you want to print.
- 2 Click *File*, then click *Print*.
- 3 In the Print dialog box, select the print options you want, then click *OK*.
- 4 In the next Print dialog box, click *OK*.

22.3.6 Exporting a View

You can export a tabular or graphical view to one of the following file formats:

- ♦ HTML
- ♦ Comma-delimited text files (.csv)
- ♦ Tab-delimited text files (.txt)
- ♦ Blank-space-delimited text files (.txt)

To export a view:

- 1 Go to the view you want to export.
- 2 Click *File*, then click *Export*.
- 3 From the *Export File Type* drop-down list, select the format to export the view.
- 4 Enter the path and name of the file you want to save in the *Filename* field or click *Browse* to search for a location you want to export the file to.
- 5 Click *OK*.

22.3.7 Saving Views

By default, any of the changes you make to the appearance, content, sorting, or filtering of a view are discarded when you exit Novell ConsoleOne. If you want to retain the changes you have to explicitly save the view.

This section includes the following topics:

- ♦ [“Saving the Existing View” on page 863](#)
- ♦ [“Creating a New View” on page 863](#)

Saving the Existing View

If you want to permanently modify the existing view to reflect the changes you made, you can simply save the view as follows:

- 1 Modify the view as desired.
- 2 Click *View > Saving > Save*.

The next time you display the view, the changes will be retained.

Creating a New View

In some cases, you might find it useful to create a new view with the changes made. The existing view is left unmodified and you can save the new view under a different name.

To save the view under a new name:

- 1 Modify the view as desired.
- 2 Click *View > Saving > Save As*.
- 3 Enter a name for the view in the *Enter New View Name* field, then click *OK*.

22.3.8 Deleting and Renaming Custom Views

To rename or delete the custom views you have saved:

- 1 Click *View*, then *Saving*.
- 2 To rename a custom view, select the view from the *Saved Views* list, then click *Rename*.
or
To delete a custom view, select the view from the *Saved Views* list, then click *Delete*.
- 3 When you have finished modifying your saved views, click *Close*.

22.3.9 Displaying Multiple Views in Novell ConsoleOne Views

The *View* in a *New Window* option enables you to display multiple tabular views, trend views, and composite views in the Novell ConsoleOne Views window.

A *View in New Window* icon , identifies the views that you can display in the Novell ConsoleOne Views.

If you have multiple views in the Novell ConsoleOne Views, refreshing will take time.

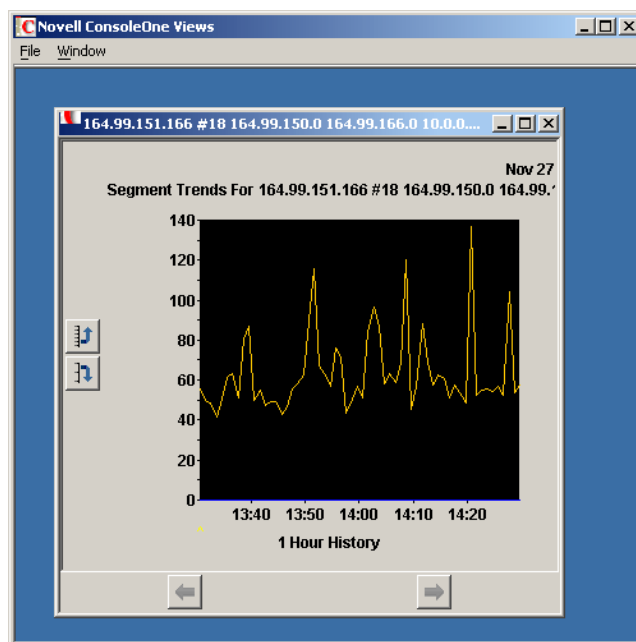

IMPORTANT: You cannot display all the views in the Novell ConsoleOne Views.

To display a view in the Novell ConsoleOne View window:

- 1 Select a view in Novell ConsoleOne.
- 2 Select *File*, then *View in New Window*.

or

Click .

You can rename the view, and also arrange the view as a tile or a cascade.

To rename a view:

- 1 In Novell ConsoleOne Views, click *File*, then *Rename*.
- 2 Specify a new name, then click *OK*.

To tile or cascade the views:

- 1 In Novell ConsoleOne Views, click *Window*, then *Tile*.
or
Click *Window*, then *Cascade*.

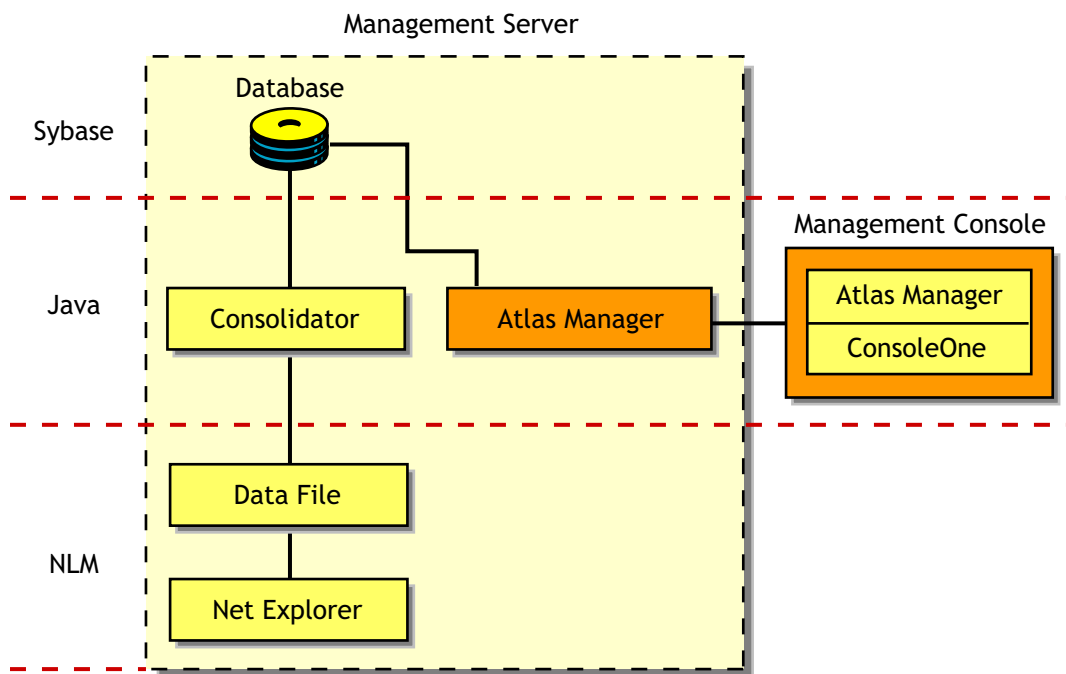

Understanding Network Discovery and Atlas Management

Discovery is the process of determining the topology of your network. You can manage, monitor and display the components of your network from Novell® ConsoleOne®. Discovery involves the following three major components of the Novell ZENworks® Server Management software:

- ◆ **Discovery software:** A set of Novell NetWare Loadable Module™ (NLM™) files that run on a management server and discovers the network topology
- ◆ **Consolidator software:** Software that runs on the management server, which reads the data discovered by discovery, and populates the Topology database.
- ◆ **Atlas Manager software:** Software that reads the Topology database, creates an atlas database, and displays the network topology in an atlas on Novell ConsoleOne.

Figure 23-1 shows a high-level view of the discovery components:

Figure 23-1 Discovery Components

This section deals with the following topics:

- ◆ [Section 23.1, “Understanding Network Discovery,” on page 868](#)
- ◆ [Section 23.2, “Setting Up Discovery,” on page 902](#)
- ◆ [Section 23.3, “Managing the Atlas,” on page 913](#)

23.1 Understanding Network Discovery

The NetExplorer™ software drives the discovery process on the management server. The discovered information is populated in the Topology database. The Atlas Manager creates a related atlas database which encapsulates the topology information and adds information related to how the user views the maps.

The following sections will help you understand the network discovery process:

- ♦ [Section 23.1.1, “Discovery Components,” on page 868](#)
- ♦ [Section 23.1.2, “Discovery Process,” on page 878](#)
- ♦ [Section 23.1.3, “What Is Discovered,” on page 886](#)
- ♦ [Section 23.1.4, “File-Based Discovery,” on page 895](#)
- ♦ [Section 23.1.5, “Discovery Console,” on page 897](#)
- ♦ [Section 23.1.6, “Effects of Discovery on Maps,” on page 900](#)

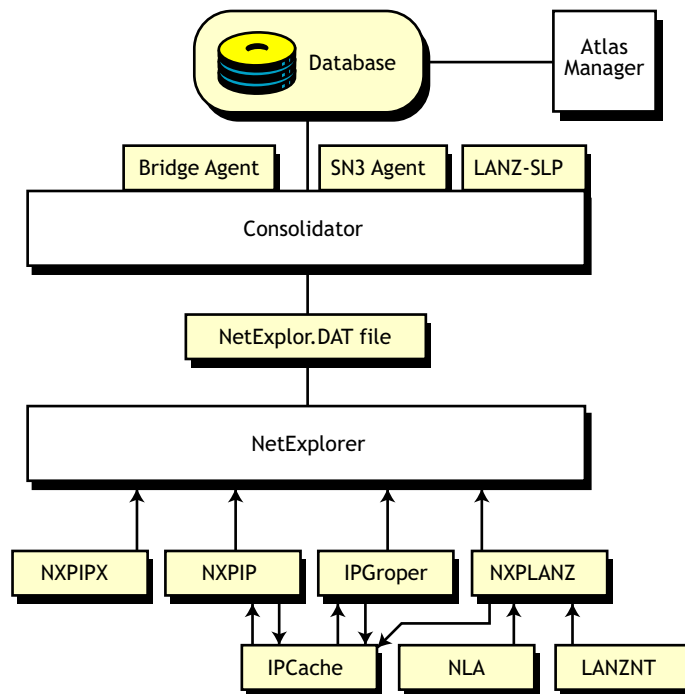

23.1.1 Discovery Components

The NetExplorer and Consolidator software that runs on the management server aids in discovering your network and updating the database.

Your network is automatically discovered by NetExplorer when you start it for the first time.

Figure 23-2 shows the discovery components on the server:

Figure 23-2 *Discovery components on the Server*

The NetExplorer system consists of the following interdependent components:

- ◆ “Discovery” on page 869
- ◆ “Consolidator” on page 871
- ◆ “Atlas Manager” on page 872
- ◆ “Database Object Editor” on page 873
- ◆ “Management Console Software” on page 877
- ◆ “Additional Novell ZENworks Server Management Components” on page 877

Discovery

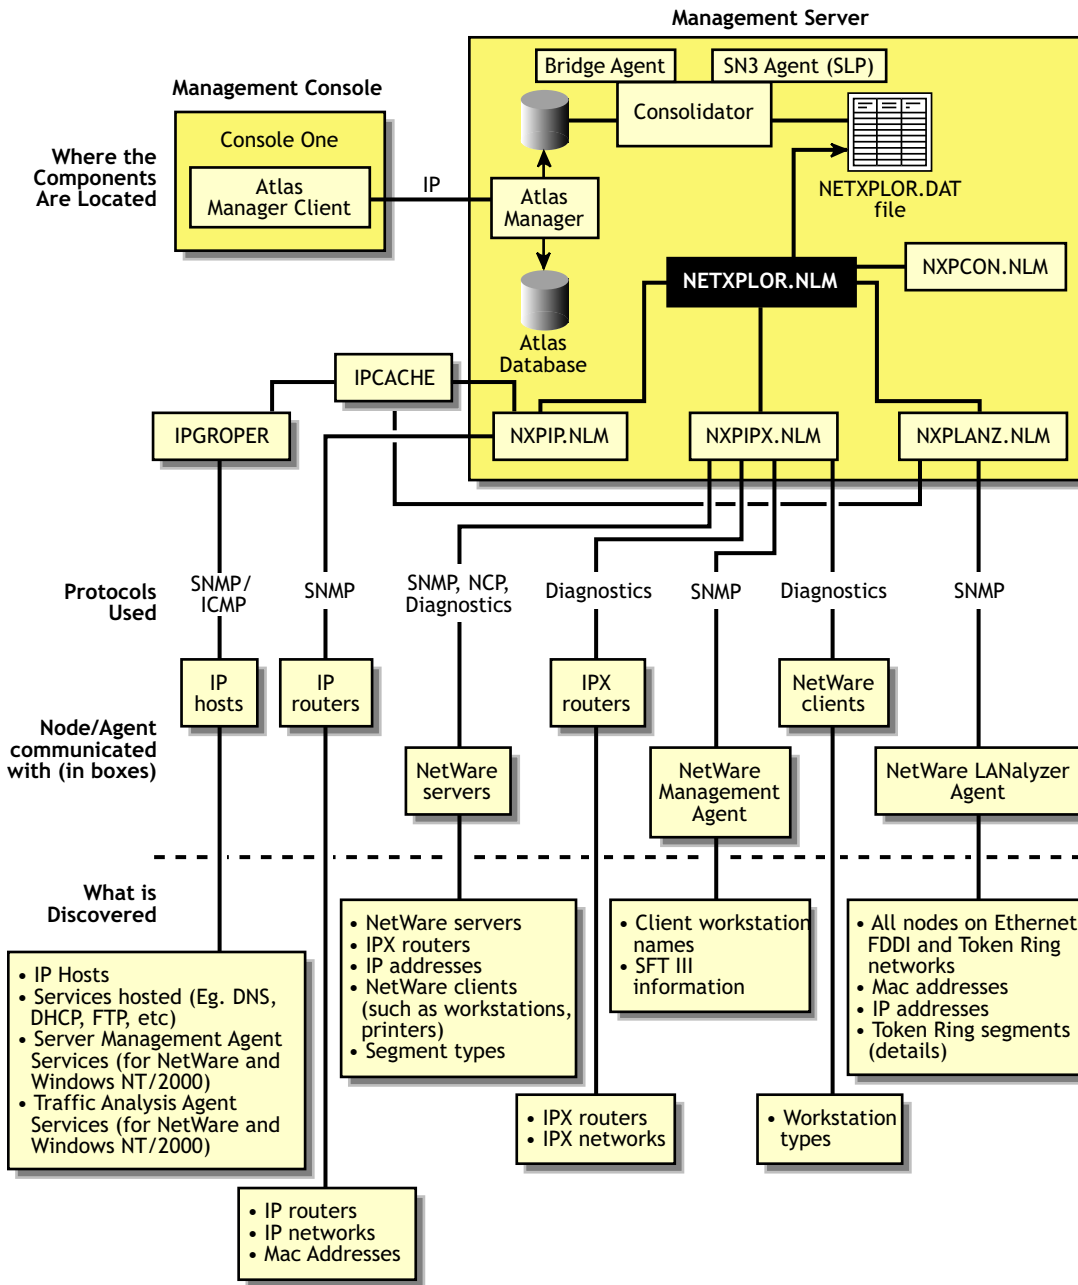

The discovery software resides on the management server and uses the discovery NLM™ software to discover the various network devices.

- ◆ `Nxpip.nlm` discovers IP routers on IP networks and sends IP router information to discovery. It communicates with the IPCACHE module to share this information with IPGROPER.
- ◆ IPGROPER detects IP host addresses and the following services: Domain Name System (DNS) names, Dynamic Host Configuration Protocol (DHCP) services, Telnet, Hypertext Transfer Protocol (HTTP), Simple Mail Transfer Protocol (SMTP), and File Transfer Protocol (FTP).
- ◆ `Nxpipx.nlm` discovers various NetWare® systems on IPX™ networks and sends information about systems to NetExplorer.
- ◆ `Nxplanz.nlm` communicates with Traffic Analysis Agents for NetWare and Windows* to gather information about all systems communicating on the segments that are monitored, and sends this information to discovery.

Figure 23-3 illustrates the architecture of the discovery system and shows the roles of the various components, network systems, and agent software.

IMPORTANT: Discovery uses the server and traffic management agents to obtain certain discovery information. Though not required, using these agents across your network enhances the accuracy and detail of logical maps displayed by Novell ConsoleOne.

Figure 23-3 Purser of the Discovery system

Supported Protocols

Novell ZENworks Server Management software supports the Service Location Protocol (SLP) on NetWare networks to enhance the discovery speed.

The server management and Traffic Analysis Agents for NetWare use the Service Advertising Protocol (SAP) to identify themselves to other components. SAP filtering prevents routers from passing SAP packets. To enable the management server and Novell ConsoleOne to receive the SAP packets that identify manageable servers, Hub Management Interface (HMI) hubs, and other servers,

configure the router that is filtering SAP packets to list the specific SAP numbers that it should pass. NetWare systems and ZENworks Server Management components use the SAP numbers listed in [Table 23-1](#).

Table 23-1 SAP Numbers used by the NetWare systems and ZENworks Server Management

Component	SAP Number (Decimal)	SAP Number (Hexadecimal)
NetExplorer NLM	567	237
Novell Server Management Agent	635	27B
ManageWise Agent for Windows server	651	28B
Traffic Analysis Agent for NetWare	570	23A
Print server	7	7
Novell NetWare file server	4	4

Consolidator

The Consolidator software resides on the management server and performs the following tasks:

- ◆ Reads the NetExplorer data files, which contains all the discovered information.
- ◆ Interprets the records in the `netexplor.dat` file.
- ◆ Checks whether the system has already been created in the Topology database. If the system does not exist in the Topology database, the Consolidator creates the system.
- ◆ Uses the Bridge agent to query the Bridge Management Information Base on IP networks and discovers which systems are connected to a port of a bridge.
- ◆ Uses the SN3 agent to get the Novell eDirectory name of NetWare servers. The SN3 agent enhances the performance of discovery by using SLP to discover NetWare servers.
- ◆ Runs the `mibcompiler.rule` file on all the discovered devices and verifies for the MIBs mentioned in the rule file on these devices and updates the database. You can also add or delete the MIBs in the `mibcompiler.rule`.
- ◆ Writes discovery information to the Novell ZENworks Server Management database.

[Figure 23-4](#) shows the tasks of the Consolidator. `Netexplor.nlm` creates the `netexplor.dat` file and the Consolidator starts reading the records from the file. If NetExplorer processes are restarted, the `netexplor.dat` file is re-created and the Consolidator requests the first record in the new file.

When the Consolidator retrieves a record from the `netexplor.dat` file, it searches for the record in the database. If the system is not in the database, the Consolidator inserts it and notifies the Atlas Manager of the update.

Figure 23-4 Consolidator Tasks

Command Line Options

If you want to manually operate the Consolidator, use the command line options shown in [Table 23-2](#).

Table 23-2 Command Line Options for the Consolidator

Option	Allows the Consolidator to
-notify	Notify the Atlas Manager that it has updated the database.
-database <i>data_path</i>	The specific location of the database file to perform operations on.

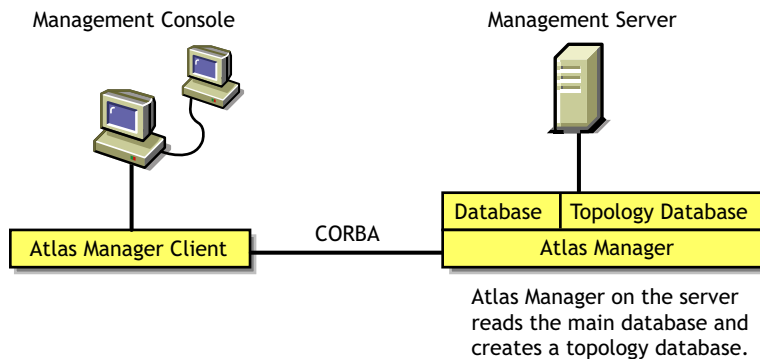

Atlas Manager

The Atlas Manager software consists of a server and a client component. The server component resides on the management server along with the Novell ZENworks Server Management topology database. The Atlas Manager server component retrieves discovery data from the topology database and creates its own atlas database.

The client component of the Atlas Manager resides on Novell ConsoleOne. The server component can communicate with several console components at any given time. Any changes made to the maps on the console (for example, rename, import, and layout) are communicated to the Atlas Manager server component, to update the atlas database.

[Figure 23-5](#) shows the Atlas Manager server and client software:

Figure 23-5 *Atlas Manager server and client software*

The Atlas Manager looks for a rule in its rules table to help classify the system. The rules help the Atlas Manager make decisions, such as which icon should be used to display the system on the maps. If the system in the record matches one of the rules, the Atlas Manager updates the database according to the rule.

Database Object Editor

The Database Object Editor supplements the discovery system. Sometimes auto discovery might not discover devices on your network, or might display incorrect information of the devices on your network. You can use Database Object Editor to add the missing entities into the database or to edit incorrect information of the entities.

The Database Object Editor client uses ConsoleOne snap-in to display the user interface. Using the Database Object Editor, you can perform operations on a segment or a node.

The Database Object Editor Server interacts with the Consolidator to process information related to the node and segment object and populates the topology database with this information.

You can use the Database Object Editor to add or delete a segment or a node and modify the segment or the node information.

To add a segment or a node:

- 1 In ConsoleOne, select *Atlas*, then click *Tools > Database Object Editor > New*.
- 2 Enter the details for the segment or the node.
- 3 Click *OK*.

To edit the information about the segment or the node:

- 1 In ConsoleOne, select the segment or the node you want to edit.
- 2 Click *Tools > Database Object Editor > Edit*.
Modify the required information.
- 3 Click *OK*.

To delete the segment or the node:

- 1 In ConsoleOne, select the segment or the node you want to delete.
- 2 Click *Tools > Database Object Editor > Delete*.

To add or delete list of MIBs to a node:

- 1 In ConsoleOne, select the node where you want to add/delete the MIBs.
- 2 Click *Tools > Database Object Editor > Edit*.
- 3 Select Implemented MIBs on the left pane to add or delete MIBs.

To add or delete list of services to a node:

- 1 In ConsoleOne, select the node where you want to add/delete services.
- 2 Click *Tools > Database Object Editor > Edit*.
- 3 Select *Services* on the left pane to add or delete services.

NOTE: If you install the LANalyzer service on a node, the RMON service is also automatically installed because the LANalyzer service cannot function without the RMON service. The Service pane of the Database Object Editor displays LANalyzer service only.

To add, delete, or modify the interfaces of a node:

- 1 In ConsoleOne, select the node whose interfaces you want to add/delete/modify.
- 2 Click *Tools > Database Object Editor > Edit*.
- 3 Select *Interface Summary* on the left pane to add/delete/modify interfaces.

To modify operating system of a node:

- 1 In ConsoleOne, select the node whose operating system you want to modify.
- 2 Click *Tools > Database Object Editor > Edit*.
- 3 Change the type of Operating System in the *Operating System* field.

To add, delete, or modify the switch port to the end node connectivity:

- 1 In ConsoleOne, select the switch whose connectivity needs to be added/deleted/modified.
- 2 Click *Tools > Database Object Editor > Edit*.
- 3 Select *Switch Summary* on the left pane to add/delete/modify switch port to node connectivity.

Working with Unnumbered Links

Unnumbered links are point to point links between routers with no IP address bound to interfaces on the two ends of the WAN link.

The Router Discovery Module (NXPIP) discovers unnumbered WAN links between routers using the following methods:

- ♦ **Auto Discovery of Unnumbered Links:** In this method, the router tables for each router is obtained. The unnumbered links between two routers are identified by correlating the routers that point to each other.
- ♦ **Manual Configuration of Unnumbered Links:** You can use this method of discovery in scenarios where auto discovery fails to discover a link or incorrectly discovers a link. Using the `nxpip.ini` file you can specify a link between two routers having unnumbered interfaces or prevent auto discovery from creating a link. Refer to the `nxp.ini` file in the `installation_directory\novell zenworks\mms\mwserver\nmdisk` directory for configuration details.

If the interface type of the unnumbered link that is discovered is not a PPP, ATM, FrameRelay, or X 25, the unnumbered link will be created with the interface type as unknown.

To enable the unnumbered link discovery, make the following changes in the `netexplor.ncf` file:

- 1 Open the `netexplor.ncf` file in the `installation_directory\novell zenworks\mms\mwserver\nmdisk` directory.
- 2 Locate the line `Load NXPIP`. If you are unable to find this line, use `NXPCON` to enable the `NXPIP` module. This line will now be added to the `netexplor.ncf` file.
- 3 Add the following options: `/autould/iniuld`. The line should now read as follows:
`Load NXPIP /autould/iniuld`.

NOTE: Add any one of the numbered IP address of the routers to the additional routers list. For more information on how to add the additional routers, see [“Specifying a Seed Router and Additional IP Routers” on page 910](#).

When you restart NetExplorer, the unnumbered links will be discovered and displayed in the atlas namespace.

Viewing the Unnumbered links in the Atlas Namespace

To view the unnumbered links on a router:

- 1 Go to the properties page of a router.
- 2 Select the *Computer Attributes* tab.
- 3 The *IP Address* field displays the string Unnumbered IP Address (*n*), where *n* is the number of unnumbered interfaces of the router.

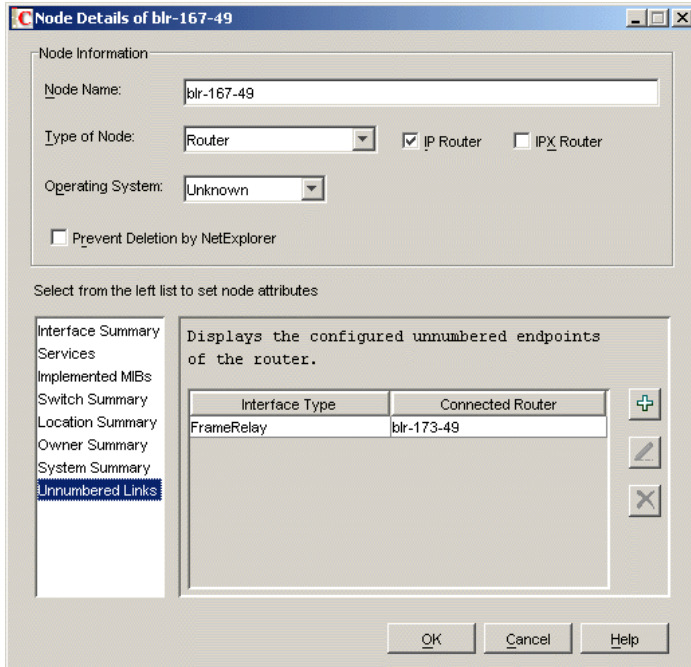

To view the unnumbered links on a segment:

- 1 Go to the properties page of a segment.
- 2 Select the *Segment Attributes* tab.

The Unnumbered Network string is used in the *IP Address* field to display the network number of the unnumbered link.

Using the *Unnumbered Links* tab in the Database Object Editor you can add, modify, or delete the unnumbered links for the router. The unnumbered links includes the interface type and the connected router. All the unnumbered links you created and configured will be displayed in the list.

Figure 23-6 *Unnumbered Links*

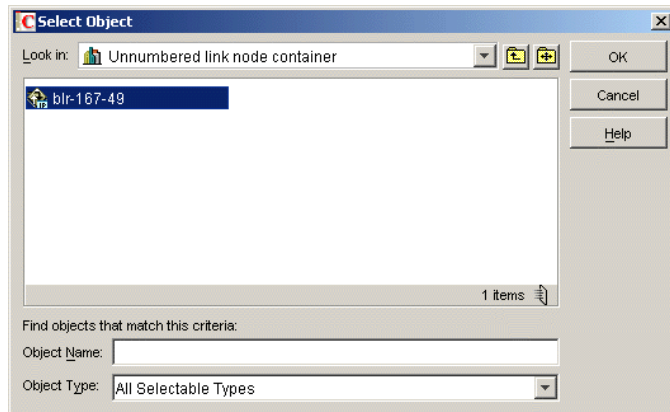

Adding an Unnumbered Link

- 1 In the *Unnumbered Links* tab, click *Add*.

- 2 In the *Interface Type* drop-down list, select the interface type of the router.
- 3 Click *Browse* to select the router that you want to connect.

- 4 Click *OK*.

Editing an Unnumbered Link

- 1 In the *Unnumbered Links* tab, select the unnumbered link you want to edit from the list, then click *Edit*.

- 2 In the *Interface Type* drop-down list, modify the interface type of the router.
- 3 Click *Browse* to select the router that you want to connect.
- 4 Click *OK*.

Deleting an Unnumbered Link

- 1 In the *Unnumbered Links* tab, select the unnumbered link you want to delete from the list.
- 2 Click *Delete*.

If you delete any of the connected node, the corresponding unnumbered link will be deleted. All the information pertaining to the unnumbered link will be updated in the database.

Management Console Software

The management console software snaps in to Novell ConsoleOne. Management sites are created in Novell ConsoleOne. In each site, an atlas is created that maintains the integrity of the discovery information.

Additional Novell ZENworks Server Management Components

The `nxpip.nlm`, `nxpipx.nlm`, and `nxplanz.nlm` software operate in conjunction with the following components:

- ♦ “Traffic Analysis Agent for NetWare Servers” on page 877
- ♦ “Server Management Agent for NetWare Servers” on page 878
- ♦ “Bindery of Novell NetWare Servers” on page 878

Traffic Analysis Agent for NetWare Servers

The Traffic Analysis Agent for NetWare is a set of NLM files that provides traffic analysis of Ethernet, Fiber Distributed Data Interface (FDDI), or token ring segments. The Traffic Analysis Agent discovers all systems on the segments it monitors, regardless of the protocols the systems use. You can monitor multiple segments by placing agents on each segment.

The `nxplanz.nlm` software on the management server uses SNMP to query servers running the Traffic Analysis Agent for information about each system that resides on their segments.

IMPORTANT: For an effective discovery process, you should have the Traffic Analysis Agent monitoring each source-routed token ring segment.

Server Management Agent for NetWare Servers

To discover IPX servers and workstations, managed servers are any NetWare servers with the server management agent installed. Server management agents respond to SNMP queries from `nxpipx.nlm` with the username and address of those workstations that are logged in to the server. `Nxpipx.nlm` obtains SFT III™ server information from the server management agent. For effective results, you should install a management agent on every NetWare server on your network.

Bindery of Novell NetWare Servers

`Nxpipx.nlm` queries all NetWare servers for information in their binderies. All NetWare servers allow their binderies to be examined by the discovery process when their security settings are set to the default values.

For the NetExplorer NLM software to discover the login names of workstations attached to a NetWare server, a server management agent must be installed on the server.

23.1.2 Discovery Process

NetExplorer discovers your network continually. The following sections discuss the discovery processes:

- ♦ [“Discovery Cycles” on page 878](#)
- ♦ [“Continuous Discovery” on page 883](#)

Discovery Cycles

When you first start discovery, you should let it run as long as necessary to build the baseline data. Very small networks might take one or two hours, while very large networks (several thousand nodes) might require a day or two to be discovered.

The discovery process occurs in cycles. A cycle is the process by which a discovery module identifies every node it can at a time. You can configure discovery on the server to discover only certain addresses, thus reducing the duration of a cycle. For more information, see [“Changing the Discovery Scope” on page 907](#).

The initial cycle continues until no additional devices are discovered. This initial cycle gathers information that might be insufficient to classify certain devices or to identify the correct segment for each device. Further discovery cycles provide additional, new, and changed information. As discovery cycles proceed, the information becomes more accurate.

Each discovery process queries the network using different methods to discover systems. Four independent discovery modules run in the order mentioned below during each discovery cycle:

1. IP router discovery on IP networks only.

This process, run by the NXPIP module, starts from the local router. Using the local router's routing table information, NXPIP discovers other routers on the network. It then uses the routing table information to further discover the network. This process is repeated for each router discovered.

The NXPIP module stores the router address information and information about any IP-bound network device in the IPCACHE module.

`Nxpip.nlm` is installed on the management server. It uses SNMP to discover IP routers. To use this NLM, your management server must also be running TCP/IP bound to at least one of your network's interface boards. `Nxpip.nlm` uses MIB-II information, such as the system table, routing table, interface table, interface data-link type and frame type, and segment data-link type. Note that because there are different versions of MIB-II implementations for different vendors, the information you receive might differ.

IMPORTANT: If you have specified an additional level of control by allowing certain IP addresses to perform SNMP queries to the routers, ensure that the IP address given to the Novell ZENworks Server Management server is privileged to query all the routers in the network. Otherwise, discovery will not be complete, and incomplete network information will appear in the Islands page of the atlas.

2. IP discovery of workstations and servers.

This process, run by the IPGROPER module, receives the router and network information written into the IPCACHE by the NXPIP module as the input. RMON, based discovery run by the NXPLANZ module also writes the information about the networks and IP hosts that it discovers into IPCACHE. This also acts as an input to the IPGROPER module.

It queries each router that has been discovered by NXPIP for its ARP tables, identifying each active IP host on the network. For IP addresses that are not found in the ARP table of any of the routers, IPGROPER tries to ping and identify whether a host by that IP address is alive.

IPGROPER queries each IP host that is identified to be alive for information about the following hosted services: HTTP, DHCP, Telnet, SMTP, and DNS. It also verifies whether the server management software and the Traffic Analysis Agents are installed and running on this host.

Simultaneously, the IPGroper module queries the DNS server specified in the `sys:\ect\resolv.cfg` file on the management server for the DNS names of all these IP hosts.

IMPORTANT: For a server or a segment to be manageable, it is important to discover the server management agent and the Traffic Analysis Agent running on an IP host on that server or the segment.

3. IPX discovery on all networks, including NetWare/IP networks:

This process, run by the NXPIPX module, starts at the management server itself to discover its IPX address, the LAN type of each adapter, and SAP information about other known devices and their services. After gathering this information, NXPIPX requests the same types of information from each device listed in the bindery. This process is repeated each time NXPIPX discovers a new device.

Nxpipx.nlm uses a variety of NetWare, SNMP, and IPX protocols, such as IPX diagnostics, to discover NetWare servers, IPX routers, and IPX workstations.

IMPORTANT: When nxpipx.nlm is loaded, a working directory named NXPWORK is created by default under the `installation_volume\install_dir\Novell ZENworks\mms\mwserver\nmdisk` subdirectory. During installation, you can specify a different path to create the NXPWORK subdirectory. NXPIPX puts all of its temporary files in this directory. Do not read, modify, or delete any file in this directory because this might cause some discovery process to not function.

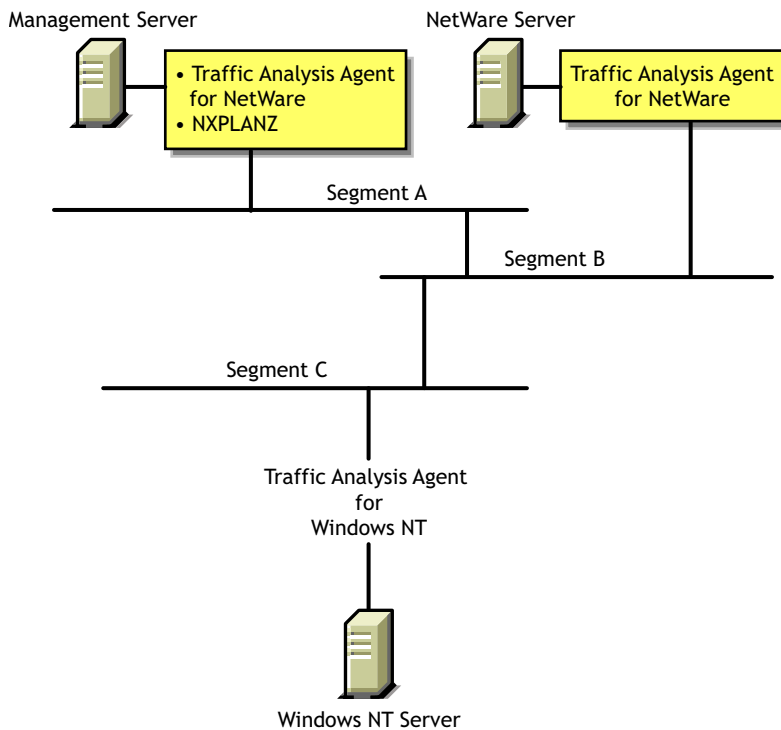

4. RMON based discovery of IP Hosts.

This process, run by the NXPLANZ module, starts by identifying all the remote agents, which includes the Traffic Analysis Agents for NetWare and Windows. The Traffic Analysis Agents on a segment discover devices based on the IP address to MAC address binding data contained in packets that are transmitted on the segment. The NXPLANZ module on the management server retrieves the data by using SNMP to communicate with the Traffic Analysis Agents.

The NXPLANZ module reports information about the Traffic Analysis Agents on your network and the IP hosts on the segments monitored by these Traffic Analysis agents to NetExplorer. The information about the networks monitored by the Traffic Analysis Agents and IP hosts on the monitored networks is also written to IPCACHE to enhance the effectiveness of service discovery by the IPGROPER module.

Figure 23-7 shows NXPLANZ querying Traffic Analysis Agents software on segments B and C, respectively.

Figure 23-7 NXPLANZ Querying Traffic Analysis Agent Software

To improve the effectiveness of the discovery, ensure that the Traffic Analysis Agent is installed and running on each network segment that you want to discover. If SLP is disabled on your network or if SAP packets are filtered by the routers in your network, NXPLANZ may not be able to discover all the Traffic Analysis agents in the network.

In order to ensure that all the Traffic Analysis agents on your network are being queried by the NZPLANZ or NXPLANZ module, specify these Traffic Analysis agents explicitly using NXPCON.

During the initial discovery cycle, these modules run sequentially. As a result, information about the Traffic Analysis Agent software is discovered late.

In later discovery cycles, the four modules run concurrently. They continue their discovery processes, but send only new or changed data to `netexplor.nlm`. As additional data arrives, segments can be consolidated, devices can be placed on the appropriate segments, and new devices can be discovered.

Each succeeding cycle of different discovery NLM files has the potential to provide key information that finally identifies a device and provides sufficient data for NetExplorer to consolidate the data.

The data discovered by the NLM processes is communicated to Novell ConsoleOne through the Atlas Manager. [Figure 23-8](#) shows the relationship of the discovery NLM processes, NetExplorer, and Novell ConsoleOne. See [“Discovery Process” on page 878](#) for a description of how these pieces operate together to discover the contents and topology of a network.

Figure 23-8 The relationship of the discovery NLM processes, NetExplorer, and the management console

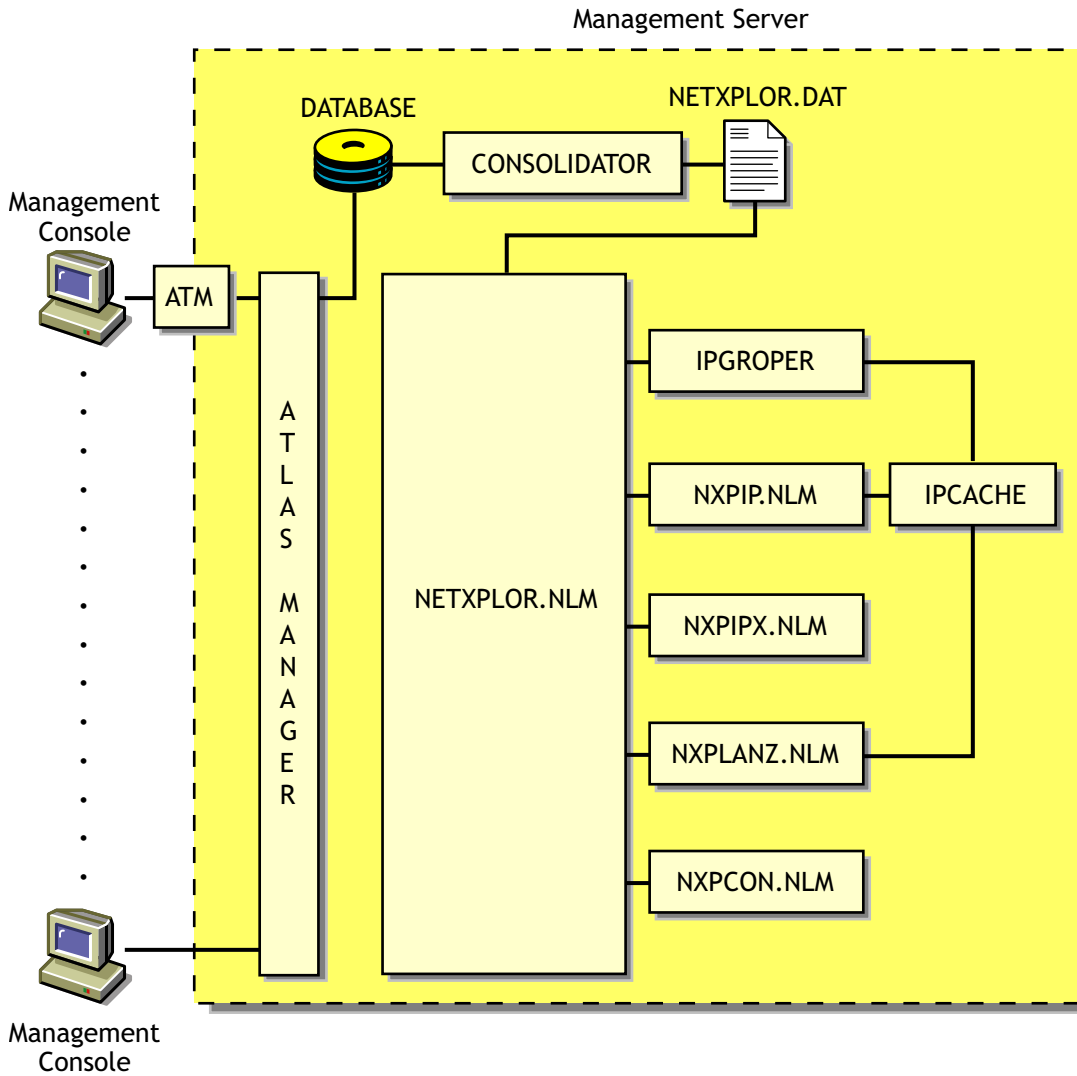

Table 23-3 summarizes the default seed and scope and user-definable changes for each discovery module:

Table 23-3 Summary of the default seed, scope and user-definable changes for each discovery module

Discovery Module	Default Seed Information	Default Scope	User-Definable Changes
NXPIP	Examines the management server routing table. Places the router addresses in the IPCACHE module.	Entire network if community string matches.	Reduce scope by specifying IP scope information in NXPCON. If public SNMP community string is not used, list SNMP community strings of routers in NXPCON.

Discovery Module	Default Seed Information	Default Scope	User-Definable Changes
IPCACHE	Supporting module in NetExplorer. Contains temporary information about devices and networks which is used by NXPIP, IPGROPER and NXPLANZ.		
IPGROPER	<ol style="list-style-type: none"> 1. Queries each router address in IPCACHE for ARP tables to identify network devices. 2. Queries each network device for the services it hosts (FTP, HTTP, Telnet, SMTP, DNS, and DHCP) and their DNS names. 3. Discovers hosts running server management and Traffic Analysis Agents. 	All IP networks connected to routers already discovered by NXPIP	<ul style="list-style-type: none"> ◆ Enable or disable autodiscovery ◆ Enable or disable file-based discovery
NXPIPX	Examines the management server's configuration.	Entire IPX internetwork.	Reduce scope by specifying IPX scope information in NXPCON.
NXPLANZ	Examines the list of servers running Traffic Analysis Agent software listed in NXPCON.	All segments with Traffic Analysis Agent software.	Specify name and IP addresses of Traffic Analysis Agent for Windows in NXPCON. If SLP is disabled or SAP is being filtered, specify the name and address in NXPCON for the Traffic Analysis Agent for NetWare.

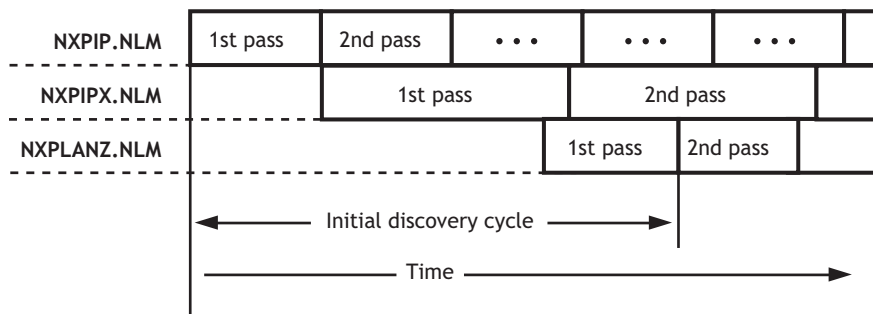

Continuous Discovery

NetExplorer discovers the internetwork on which it resides, through a process initiated and controlled by `netexplor.nlm`. Initially, each discovery NLM identifies itself to `netexplor.nlm`, which then begins the initial discovery cycle. The cycle starts with NXPIP discovery, followed by NXPIPX discovery, and finally NXPLANZ discovery. The discovery cycles of IPGROPER are not controlled by `netexplor.nlm`. After starting, it runs continuously. Information gathered by NetExplorer is stored in the `netexplor.dat` file on the management server.

In [Figure 23-9](#), each of the discovery processes is shown in relationship to time. After NXPIP finishes its first pass, NXPIPX begins and NXPIP starts over. After NXPIPX finishes its first pass, NXPLANZ begins and NXPIPX starts its second pass.

Unless otherwise directed, all three of the discovery processes run continually to detect changes to the network. Any changes to the network are saved as records in the `netexplor.dat` file. When all three discovery processes have completed one pass, the initial discovery cycle is complete.

Figure 23-9 The discovery processes in relationship to time

The following sections describe each sequence in greater detail:

- ♦ [“NXPIP” on page 884](#)
- ♦ [“NXPIPX” on page 884](#)
- ♦ [“NXPLANZ” on page 885](#)
- ♦ [“IPGROPER” on page 885](#)
- ♦ [“NETXPLOER” on page 885](#)
- ♦ [“SNMP Community String Discovery” on page 885](#)

NXPIP

The first sequence in the NetExplorer discovery cycle involves the discovery of IP routers. NXPIP locates its local router using TCP/IP configuration information. NXPIP then queries the router for the identity of other routers on the network. NXPIP queries the MIBs on the routers using SNMP to collect the IP addresses, interface types, and MAC addresses.

By default, NXPIP attempts to discover your entire IP network. You can restrict the scope of the IP discovery by specifying the scope information in NXPCON.

NXPIPX

NXPIPX uses a series of techniques, including SNMP, RIP, IPX, and SPX™ diagnostics to discover the attached IPX or NetWare/IP internetwork. After NXPIP completes its first pass, NXPIPX begins discovery at the management server. NXPIPX examines its own server and discovers the names of other servers. It then queries each of these servers to discover more servers and repeats this process until no more servers are found.

In addition, NXPIPX reads the connection table of each NetWare server to determine which NetWare clients are logged in to the server. NXPIPX sends IPX diagnostic packets to each client to collect additional information. NXPIPX will not discover clients that do not appear in the connection table because they have not been logged in recently and clients whose diagnostics are turned off. It is therefore important to leave IPX diagnostics enabled on NetWare clients.

NXPIPX also discovers IPX routers in your network. Third-party IPX routers are discovered only if there is a NetWare server on the routed segment. NXPIPX does not discover interface information when routed segments do not have NetWare servers.

By default, NXPIPX attempts to discover your entire IPX internetwork. You can restrict the scope of discovery by specifying a list of IPX network numbers using NXPCON. For NXPIPX to discover other IPX nodes ensure that one of the IPX numbers is bound to the management server.

NXPLANZ

The Traffic Analysis Agent for NetWare monitors every packet on the network segment it is installed on. It creates a list of physical (MAC) addresses and IP addresses of all the systems communicating on the segment on the local memory. After NXPIPX completes its first pass, NXPLANZ uses SNMP to query all servers with Traffic Analysis Agents installed to read the list of workstations communicating on the network. NXPLANZ also obtains a list of the agents running on the servers from NXPIPX.

IPGROPER

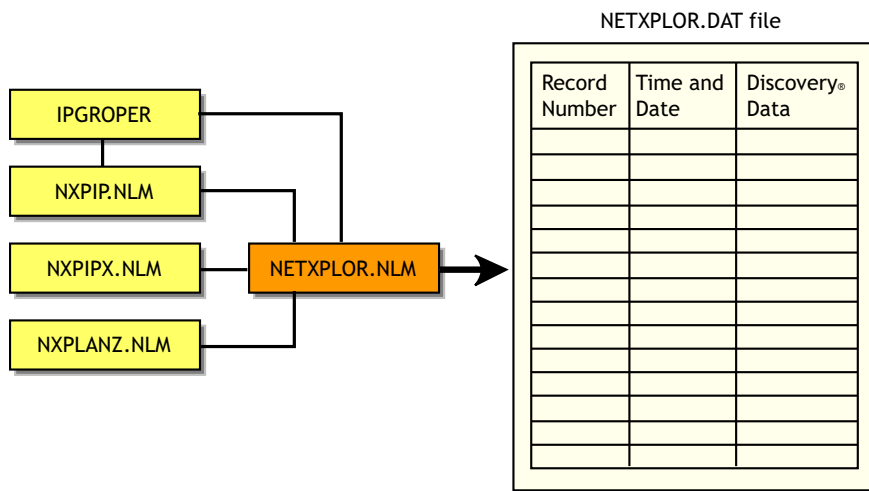

The information about the routers and network segments written into IPCACHE by NXPIP, and the information about network segments, and hosts written to IPCACHE by NZPLANZ forms the input to the IPGROPER module. For each network segment, IPGROPER tries to discover all the hosts on that network, the DNS names of the hosts, the services hosted on them, server management agents, and Traffic Analysis Agents.

NETXPLOER

As the discovery processes gather information about systems on the network, they forward packets of related data to `netexplor.nlm`. `netexplor.nlm` places these packets, along with a record number and a time stamp, into the `netexplor.dat` file, as shown in [Figure 23-10](#).

NOTE: Discovery re-creates the `netexplor.dat` file each time you load `netexplor.nlm`. Therefore, the discovery data stored at the management server from previous runs of the NetExplorer NLM processes is not retained when you restart `netexplor.nlm`.

Figure 23-10 Discovery process of `NETXPLOER.NLM`

SNMP Community String Discovery

Each time NetExplorer tries to access a system through SNMP, it uses the community strings that have been configured using the NXPCON utility on the management server. When it encounters a new system, it tries each of the configured community strings. After it has found a community string for a particular IP or IPX address, it records this name in a file so that in subsequent cycles it does not need to retry with the other configured names.

You can view these community strings using NXPCON. The community strings are used in the order specified. Therefore, the most-used community string should be configured first in the list.

IMPORTANT: An SNMP query with an invalid SNMP community string results in no response from the target system and the request times out.

23.1.3 What Is Discovered

NXPIP, NXPIPX, and NXPLANZ use a variety of techniques to discover the following categories of network objects and present them in the atlas:

- ♦ “Systems” on page 886
- ♦ “Network Segments” on page 893

Generally, information gathered by NXPIP and NXPIPX is sufficient to place systems on the network maps correctly. When NXPIP and NXPIPX have not discovered systems, NXPLANZ retrieves MAC addresses collected by the Traffic Analysis Agent software and the new systems are added to the database. Consequently, all systems are discovered on segments monitored by the Traffic Analysis Agents.

Systems

Table 23-4 shows the different types of systems discovered:

Table 23-4 *Types of systems discovered*

System	Comment
Novell Server Management Agent	Service type of 563 decimal (Novell Server Management Agent 1.5 or 1.6) or 635 decimal (Novell Server Management Agent 2.6) or Novell Server Management Agent MIB implemented.
Management Agent for Windows	Management Agent MIB implemented.
Traffic Analysis Agent for NetWare	Service type of 570 decimal or Traffic Analysis MIB implemented.
Traffic Analysis Agent for Windows	Traffic Analysis MIB implemented
Novell NetWare File Server	Service type of 4 (file server). NXPIPX discovers all NetWare servers.
Novell NetWare Print Server™	Service type of 71 or 7 decimal.
IPX Router	System with more than one adapter connected to different IPX networks.
IP Router	System that is configured as an IP router in MIB-II (IP forwarding enabled).
Novell NetWare Client Workstation	System that responds to IPX diagnostics requests as an IPX workstation (has the Novell NetWare Shell loaded).
SFT III IOEngine	Discovered by the IPX discovery module; responds with diagnostic information.

System	Comment
SFT III MSEngine	Discovered by the IPX discovery module.
Network Printers	Discovered if the printer generates a well-known service type.
Novell NetWare Connect™	Service type of 590 decimal.
Novell NetWare Communications Server	Used by the Novell NetWare for SAA* services manager products; has a service type of 304 decimal.
Management Server	Running discovery NLM files; has a service type of 567 decimal.
Any System	Any system is discovered if it is connected to a LAN segment being monitored by a Traffic Analysis Agent.

The different types of services discovered are Telnet, HTTP, DNS, SMTP, DHCP, Routers, Novell eDirectory, SFTIII, and SNMP.

The following sections contain more information about the various systems that are discovered:

- ♦ “Novell NetWare Client Workstations” on page 887
- ♦ “IP Routers” on page 888
- ♦ “Novell NetWare SFT III” on page 889
- ♦ “Systems Not Equipped with the IPX Diagnostic Responder” on page 890
- ♦ “Routers that Use Duplicate MAC Addresses” on page 890
- ♦ “Third-Party Routers” on page 891
- ♦ “Novell NetWare MultiProtocol Router with WAN Ports” on page 891
- ♦ “IPX Networks” on page 891
- ♦ “IP Networks” on page 892
- ♦ “On-Demand Links” on page 892
- ♦ “Third-Party Routers with WAN Ports” on page 892
- ♦ “Novell NetWare Connect Servers” on page 892
- ♦ “Virtual Switches” on page 892

Novell NetWare Client Workstations

NXPIPX discovers all Novell NetWare client software attached to discovered NetWare servers. Clients that are turned off or are not attached to a server are not discovered. For this reason, a NetExplorer process that is run at night or on a weekend might not yield a complete map. Note that NetWare clients must have IPX diagnostics enabled.

When you configure a NetWare client to perform a bindery login, consider the scenarios in [Table 23-5](#):

Table 23-5 Bindery Login Scenarios

Server	Bindery Login—What Is Discovered
Novell NetWare with server management agent installed	Workstation discovered; name is discovered only if logged in with IPX as the transport for Novell NetWare 4.x and Novell NetWare 5.x
Novell NetWare	Workstation discovered; name is not discovered

When you configure the client to perform a directory login, NetExplorer discovers only those systems that are logged in to an Novell eDirectory tree and not those that are merely attached to the Novell eDirectory tree. NXPIPX uses SNMP community string to communicate with the management agent and query on all NetWare servers for the username.

After NetExplorer discovers a NetWare client, NXPIPX queries the client using the IPX diagnostic protocol to confirm the discovery and gather more information about it. If IPX diagnostics are turned off, NXPIPX does not report the system. This applies to printers as well.

IP Routers

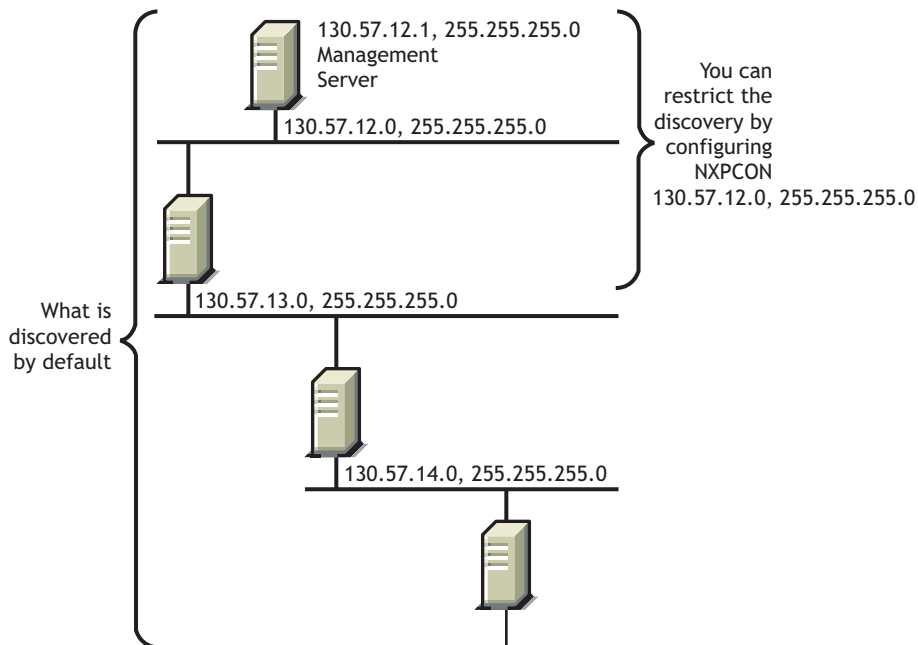

NXPIP uses SNMP to query all IP routers on the network by using the SNMP community string used by the routers. You must enter the list of community strings used by your routers using NXPCON.

You can configure this information into the router's MIB by using any SNMP configuration tool, including the SNMP MIB browser. If you configure router information such as the system name in the routers SNMP MIB, the discovery process records it in the database, allowing IP routers to be displayed with meaningful names.

By default, IP discovery discovers the entire network. The exploration can be restricted by specifying network numbers using the NXPCON Discovery Scope, and then IP Discovery Scope option. Also, if there are redundant IP routers, use the NXPCON IP Discovery, and then the IP Routers option to specify the redundant IP router address; otherwise, NXPIP does not discover it. As shown in [Figure 23-11](#), if the management server IP address is 130.57.12.0, the IP discovery NLM discovers the entire 10.57.85.0 network and its subnets.

[Figure 23-11](#) shows how Novell ZENworks for discovers IP routers:

Figure 23-11 Novell ZENworks for discovery of IP routers

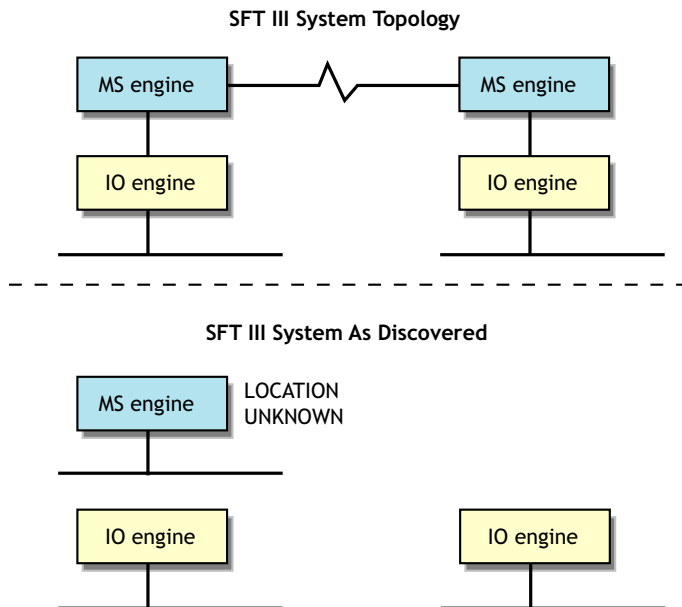

Novell NetWare SFT III

A NetWare SFT III™ server usually consists of two computer systems, each containing an input/output engine (IO engine) and a mirrored server engine (MS engine). Therefore, physically there are two IO engines and two MS engines; logically there are two IO engines and one MS engine.

If Novell Server Management Agent is loaded on an SFT III server, the MS engine and both IO engines are discovered correctly with their names and placed in the correct segment in the atlas. However, the MS engine is placed in the Islands page. This happens because the two MS engines are associated with only one logical server on the network, and the location of the MS engine might change depending on which copy of the MS engine is the primary at any given time.

Figure 23-12 illustrates NetWare SFT III server discovery:

Figure 23-12 Server discovery for NetWare SFT III

If the server management agent is not loaded on the MS engine, Discovery discovers only the MS engine and the IO engine that are primary at the time of discovery. The primary IO engine is labeled Noname in the area page. To change the name of an IO engine on a segment map, right-click the icon and click Rename.

Systems Not Equipped with the IPX Diagnostic Responder

NXPIPX discovers the following systems, but does not necessarily place them correctly in the atlas:

- ◆ NetWare for UNIX* servers
- ◆ Portable NetWare
- ◆ Access servers
- ◆ Modem servers
- ◆ Print servers

Because these systems do not respond to IPX diagnostics, they cannot answer queries from NXPIPX. Consequently, the LAN information required to place them on the maps might not be available. In this situation, NetExplorer places these systems in the Islands page of the atlas. In most cases, the presence of a Traffic Analysis Agent on each segment on which these systems appear, enables NetExplorer to obtain the missing information and correctly locate the systems in the maps.

If these systems are running IP, they will be discovered and placed correctly in the maps.

Routers that Use Duplicate MAC Addresses

NetExplorer can experience difficulties in discovering some routers because of the method routers use to identify their adapters. In some cases, the same MAC address is used on several network interfaces of a router. In these cases, it appears to NetExplorer that one adapter is connected to multiple segments. Unless otherwise specified, NetExplorer interprets multiple adapters as one adapter.

The multiple segments connected to the adapters are seen as one segment and NetExplorer consolidates the multiple segments.

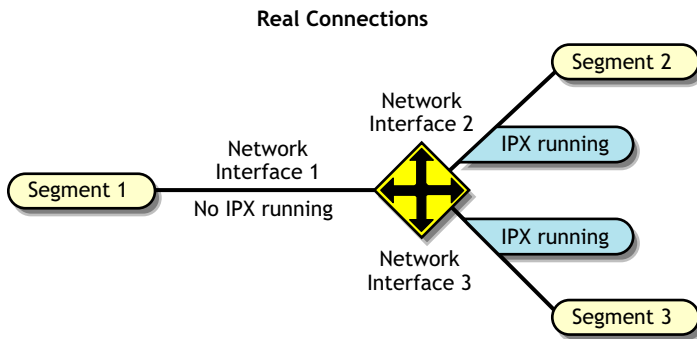

Third-Party Routers

NXPIP discovers IP-bound interfaces only. When IP is not running on a router, NetExplorer discovers the IPX-bound interfaces, which results in:

- ◆ A separate router icon is shown for each interface in the router.
- ◆ Discovered interfaces are not placed in the same router in the atlas. Therefore interconnections are incorrect on the internetwork map and the router appears as separate, multiple routers, each containing one network interface from the real router.

Figure 23-13 illustrates a router with IPX running on Network Interfaces 2 and 3 but not on Network Interface 1. NetExplorer places this router on the internetwork map as two separate systems. As shown, the connection to Segment 1 is not displayed, and the connections to Segments 2 and 3 are shown attached to two separate systems.

Figure 23-13 Internetwork map connections for an IPX router

ZENworks for Servers Internetwork Map Connections

Novell NetWare MultiProtocol Router with WAN Ports

Novell NetWare MultiProtocol Router™ (MPR) 3.0 is now bundled with Novell NetWare 5.x.

IPX Networks

Novell NetWare MPR 3.0 reports the correct segment type of the WAN links. NetExplorer detects these correctly and displays them with the appropriate icon.

IPXWAN links between Novell NetWare MPR 3.0 systems do not have an IPX network associated with them. When NetExplorer discovers such a link, it creates a name for the WAN segment of the form #UNNUM -*n*, where *n* is an integer assigned to make the segment name unique. On multi-access networks, such as frame relay and X.25, each connection in the network adds another #UNNUM -*n* to the segment name.

IP Networks

With Novell NetWare MPR 3.0, you can configure both numbered and unnumbered IP links. NetExplorer discovers numbered links correctly. NetExplorer does not discover unnumbered IP links, resulting in the Islands page.

If IP is running on a third-party router and NXPIP is running on the management server, NetExplorer discovers only the IP-bound interfaces. The router is shown correctly in the atlas. If IP is not running on a third-party router but NXPIP is running on the management server, NetExplorer discovers the IPX-bound interfaces. However, these IPX-bound interfaces are not placed in the same router icon in the atlas.

On-Demand Links

An on-demand link is a WAN connection between two routers in which only user data (no routing traffic) is exchanged across the link. The link is brought up only when there is data to send.

NetExplorer discovers on-demand IP and IPX links correctly, if sufficient static routing information has been configured to allow the management server to reach the other side of the on-demand link.

However, if a link is an on-demand and unnumbered IP link, the entire topology on the remote end of the link is not discovered. Click IP Discovery, and then the Additional IP Routers in the NXPCON utility to configure an additional IP router address for the missing router.

Third-Party Routers with WAN Ports

NetExplorer discovers third-party routers correctly if they support MIB-II SNMP. Certain third-party routers can have a WAN link with no IP or IPX network number on the link. In this case, the WAN link is not discovered.

Novell NetWare Connect Servers

NetExplorer discovers Novell NetWare Connect servers; however, if you have more than one Novell NetWare Connect[®] server on the network, NetExplorer consolidates them and they appear as one server.

Virtual Switches

A virtual switch is represented by the same icon used for a switch or bridge in the atlas maps. The display name of a virtual switch is always shown as the “switch on *IP address of network*.” It is primarily used in atlas maps to display a meaningful network topology when discovery information is incomplete. Since the addresses are not known, the MAC address of the virtual switch is specified as an *Ethernet Port* or *Token Ring Port* or *FDDI Port* based on the connectivity type.

A virtual switch is shown in atlas maps under the following conditions:

- ♦ When two or more different physical media are connected by a switch, but the switch is not yet discovered. The virtual switch disappears as soon as the real switch is discovered.

- ◆ When two or more different physical media are connected by a switch, the switch is configured with SNMP community strings other than public, and the SNMP community strings of the switch were not provided through NXPCON before starting discovery.
- ◆ When two or more different physical media are connected by a non-manageable switch or a hub.

Network Segments

NetExplorer discovers the following network segments:

- ◆ “LAN and WAN Segment Types” on page 893
- ◆ “Source-Route Bridged Token Rings” on page 893

NetExplorer cannot fully discover the following:

- ◆ “Transparent Bridges” on page 894
- ◆ “Configuration Changes” on page 895

LAN and WAN Segment Types

NetExplorer discovers the LAN and WAN segment types shown in [Table 23-6](#):

Table 23-6 List of Known and Unknown segments in CIM database

Known Segments in CIM Database	Unknown Segments in CIM Database
ATM	LAN: ARCnet
LAN: FDDI	LAN: LocalTalk*
LAN: Ethernet	SMDS
LAN: Token Ring	WAN: ISDN
WAN: X.25	WAN: SDLC
WAN: PPP	WAN: Serial
WAN: Frame_Relay	WAN: T1
	WAN: T3

These values are discovered correctly if a system connected to the segment responds with an interface type from MIB-II RFC 1573.

Source-Route Bridged Token Rings

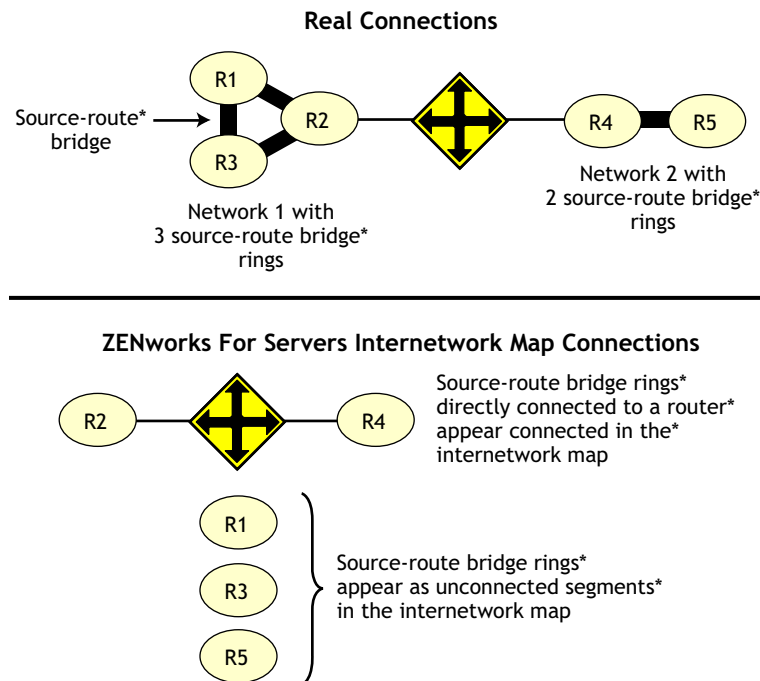

Atlas Manager displays source-route bridged token rings depending on whether the Traffic Analysis Agent for NetWare is installed on each ring.

- ◆ If you do not have the Traffic Analysis Agent for NetWare installed on each source-route bridged token ring in your network, NetExplorer discovers the network but consolidates all source-route bridged token rings that share the same IPX network number or IP subnet into a single segment. For example, in [Figure 23-14](#), rings R1, R2, and R3 are displayed as one segment, and rings R4 and R5 are displayed as another segment on the internetwork map.

- ♦ If you have the Traffic Analysis Agent for NetWare installed on each source-route bridged token ring, each Traffic Analysis Agent for NetWare discovers its own ring (segment) and every system on it. Atlas Manager displays the ring as a disconnected segment on the internetwork map.
- ♦ If you have the Traffic Analysis Agent for NetWare installed on a source-route bridged token ring connected to a router, the WAN page in the atlas shows the correct connections. However, if two networks each have several rings and only one ring in each network is connected to a router, the WAN page shows the correct connections of only the rings that are directly connected to the router. The other source-route bridged token rings in each network are displayed as disconnected segments on the WAN page.

Figure 23-14 illustrates this second case:

Figure 23-14 Internetwork Map Connections for Source Route Bridge Rings

In all cases, bridge information is not discovered. As a result, discovery treats each interface of a source-route bridge as a separate system on the network. One icon appears in the atlas for each interface of the source-route bridge.

When you have the Traffic Analysis Agent for NetWare installed on one server on each ring of an IPX source-route bridged network, the segment names displayed on the WAN page consist of the IPX network number followed by the MAC address of that server's interface to the ring. If the Traffic Analysis Agent for NetWare is monitoring more than one interface, the address shown for a ring is the MAC address of the interface monitoring that ring.

Transparent Bridges

Discovery cannot completely discover transparent bridges. It consolidates groups of transparently bridged segments running the same network number into a single segment on the maps.

Configuration Changes

Discovery detects most changes in the network topology, such as the addition, reconfiguration, or deletion of interfaces, resulting in changes being made to the atlas. However, if you remove the system from the network, it is not detected unless you move it to another location in the network.

23.1.4 File-Based Discovery

The enhancement to the `ipgroper.nlm` allows you to use the `discnodes.txt` file to specify the IP Address and mask of a set of nodes to be discovered. The information about the nodes is obtained through SNMP.

The IPGroper NLM must be loaded with specific options that enable it to receive inputs from the `discnodes.txt` file. If these options are not provided, the NLM will discover without taking input from the file. Prior to starting the discovery, the `discnodes.txt` file must be placed in the `ZENworks_installation_directory/mwserver/nmdisk` directory. After the initial discovery, if you want more nodes to be discovered, you must create a new `discnodes.txt` file with the new node entries and place it in the same directory. These nodes will be queried in the next discovery cycle.

The `discnodes.txt` input file has the following format for individual IP addresses:

- ◆ Individual IP Address specification format:

IPAddress <, SubnetMask>

- ◆ Specifying addresses using regular expressions

IPAddress <, SubnetMask>

IPAddress ->AddressPattern

Characters allowed in AddressPattern include the numerals 0-9; the period (.); the question mark (?), which represents one character; and the asterix (*), which represents more than one character, up to a maximum of three.

- ◆ Wildcard characters are not allowed in the subnet mask.

164.99.149.*	All addresses in the range from 164.99.149.1 to 164.99.149.254
164.99.14?.*	all addresses in the range from 164.99.140.1 to 164.99.149.254
164.99.149.?	all addresses in the range from 164.99.149.1 to 164.99.149.9

NOTE: 164.99.149.0 does not come into the range. ? does not stand for 0 if it is the only letter in the octet.

164.99.149.1?0- all addresses in the range from 164.99.149.100to164.99.149.190. Here ? stands from 0

- ◆ In the text file, any line that begins with a pound sign (#) is treated as a comment line.

File-based discovery can be used in the following two scenarios:

- ◆ [“Discovering the Nodes Specified in the file” on page 896](#)
- ◆ [“Discovering the Nodes with Other Discovery Modules” on page 896](#)
- ◆ [“Using Command Line Options for IPGROPER” on page 897](#)

Discovering the Nodes Specified in the file

By default, the Novell ZENworks Server Management installation loads the NXPCON utility with all the discovery modules running and with file-based discovery enabled.

To discover only the nodes specified in the input file:

- 1 In NXPCON, click *Configuration Options > Discovery Modules*.
- 2 Select *Individual Discovery Modules*, then press Enter.
- 3 Select *No* to unload the modules, then press Enter.
- 4 Press Esc to exit the Discovery Modules dialog box.
- 5 Click *Yes* to save changes.
- 6 Click *Configuration Options > IP Discovery*.
- 7 Select *IP Host Discovery*, then press Enter.
- 8 Select *Enable IP Host Discovery*, then press Enter.
- 9 Select *No* to disable autodiscovery of the IP workstation.
- 10 Make sure that the Enable File-Based Discovery option is set to *Yes*.
- 11 Press Esc to exit the IP Host Discovery dialog box.
- 12 At the Management server prompt, unload NetExplorer by entering `unxp`.
- 13 Reload the NetExplorer modules by entering `netexplor`.

Discovering the Nodes with Other Discovery Modules

By default, the Novell ZENworks Server Management installation starts all the discovery modules along with the file-based discovery. Use the following procedure to individually select the modules that need to be started or to change the configuration.

To discover only the nodes specified in the input file:

- 1 In NXPCON, click *Configuration Options > Discovery Modules*.
- 2 Select *Individual Discovery Modules*, then press Enter.
- 3 Select *Yes* or *No* to load or unload each module, then press Enter.
- 4 Press Esc to exit the Discovery Modules dialog box.
- 5 Click *Yes* to save changes.
- 6 Click *Configuration Options > IP Discovery*.
- 7 Select *IP Host Discovery*, then press Enter.
- 8 Select *Enable IP Host Discovery*, then press Enter.
- 9 Select *No* to disable Auto Discovery of the IP workstation.
- 10 Make sure that the *Enable File-Based Discovery* option is set to *Yes*.
- 11 Press Esc to exit the IP Host Discovery dialog box.
- 12 At the Management server prompt, unload NetExplorer by entering `unxp`.
- 13 Re-load the NetExplorer modules by entering `netexplor`.

Using Command Line Options for IPGROPER

The `ipgroper.nlm` has three command line options to discover nodes specified in the `discnodes.txt` file.

Table 23-7 *Command Line Options for IPGROPER*

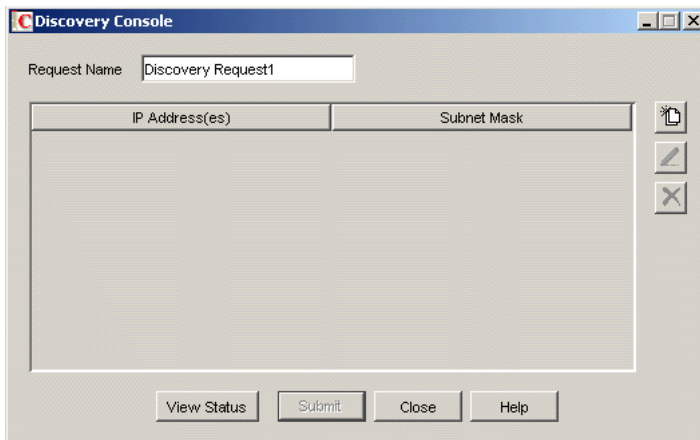

Command Line	Explanation
<code>/Fonly</code>	<p>Specifies that only the nodes specified in the <code>discnodes.txt</code> file must be discovered.</p> <p>You can set this option, when you have set <i>No</i> for the <i>Enable IP Host Discovery</i> option and <i>Yes</i> for the <i>Enable File-Based Discovery</i> option.</p>
<code>/Falso</code>	<p>Specifies that the nodes specified in the <code>discnodes.txt</code> file must be discovered along with the other nodes that IPGROPER will discover.</p> <p>You can set this option, when you have set <i>Yes</i> for both <i>Enable IP Host Discovery</i> option and <i>Enable File-Based Discovery</i> option.</p>
<code>/Flog</code>	<p>Logs all the errors and events that occur during the discovery of the nodes. The errors and the events will be logged in the <code>ZENworks_installation_directory\mwserver\nmdisk\discnodesbak\discnodeslog.log</code> file. You must manually enter this command line option in the <code>netxplor.ncf</code> file.</p> <p>IMPORTANT: The <code>discnodeslog.log</code> file will be created only if you have specified the <code>/fonly</code> or the <code>/flog</code></p>

23.1.5 Discovery Console

The Discovery Console enables you to send a request to discover a set of IP addresses using Novell ConsoleOne. You can discover a list of host addresses, all the hosts on a subnet, range of addresses, or addresses in the form of a regular expression. The Discovery Console also enables you to view the status of the requests that you have submitted, or to delete a request.

IMPORTANT: To use the Discovery Console, ensure that IPGROPER is running.

Figure 23-15 *Discovery Console*

To create and submit a request for discovery:

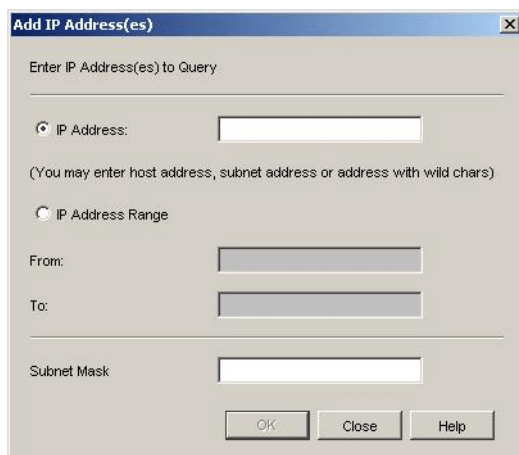

- 1 From Novell ConsoleOne, click *Tools > Discovery Console*.
The Discovery Console dialog box is displayed with a default Request Name.
- 2 Enter a different request name if you want to change the default request name.

You can perform the following operations:

- ♦ “Add IP Addresses” on page 898
- ♦ “Edit IP Addresses” on page 899
- ♦ “Remove IP Addresses” on page 899
- ♦ “View Status of a Request” on page 899

Add IP Addresses

- 1 In the Discovery Console dialog box, click .

- 2 Provide the following information:
 - ♦ **IP Address:** The host address or a subnet address. You can include wildcard characters while specifying the IP address. Specify the correct subnet mask for a subnet address.

- ♦ **IP Address Range:** The range of IP addresses to query. For example, 160.100.144.1 - 160.100.144.254.
 - ♦ **Subnet Mask:** The correct subnet mask for a specified address.
- 3 Click *OK*.
 - 4 In the Discovery Console dialog box, click *Submit*.

Edit IP Addresses

- 1 In the Discovery Console dialog box, select the IP addresses you want to edit, then click .
- 2 Modify the required information.
- 3 Click *OK*.
- 4 In the Discovery Console dialog box, click *Submit* to submit the request.

Remove IP Addresses

You can remove IP addresses if you have not added the request.

- 1 In the Discovery Console dialog box, select the IP addresses you want to remove, then click .

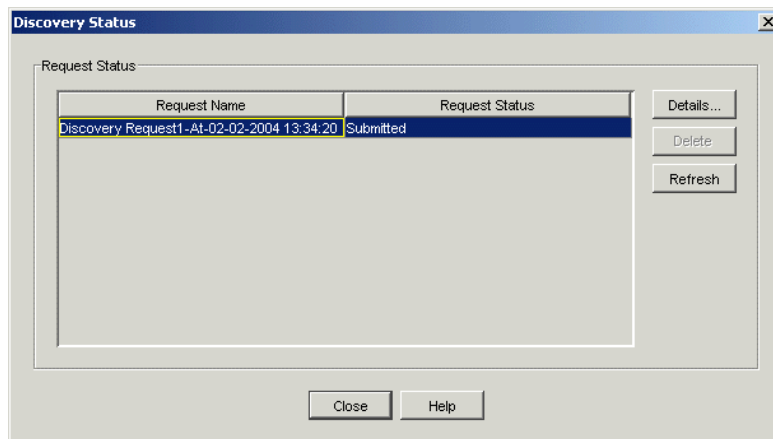

View Status of a Request

This option displays the status details of the request that you have submitted. A request can have one of the following status levels:

- ♦ **Pending:** The request is yet to be submitted to IPGROPER.
- ♦ **Submitted:** The request is submitted to IPGROPER.
- ♦ **In Progress:** The request is being processed by IPGROPER.
- ♦ **Completed:** The request is processed by IPGROPER.

To view the status of the request:

- 1 In the Discovery Console, select the request, then click *View Status*.

You can perform the following operations:

- ◆ **Details:** Displays the details for the selected request in the table.
- ◆ **Delete:** Deletes a request you selected. You can delete a request if the status is pending.
- ◆ **Refresh:** Displays the current status of the requests.

23.1.6 Effects of Discovery on Maps

The Atlas Manager on the management server creates an atlas database as the topology database is populated and the information is displayed as maps on Novell ConsoleOne. The WAN page displays all the Area pages and the connecting routers between them. The Area pages display the segments and the connecting routers.

The discovered systems are placed on the Area pages of the atlas based on the connecting routers or bridges. The Islands page contains segments for which routers have not yet been discovered. The Atlas Manager relocates the segments to the correct pages when connecting routers are discovered.

Review the following sections for more information on the effects of discovery on maps:

- ◆ [“Name Source Priority” on page 900](#)
- ◆ [“Representation of Systems in the Atlas” on page 900](#)

Name Source Priority

As discovery cycles proceed and more information is discovered, the names displayed in the maps can change. Different priorities are given to names, depending on the source of the name information. If none of the names are discovered, the IP/IPX address of the node is displayed as the node name.

To determine how to display the name of the discovered object, the Atlas Manager uses the following list in the order shown:

1. User Defined Name
2. DNS Name
3. Novell eDirectory Name
4. Bindery Name
5. SNMP Name

Representation of Systems in the Atlas

When representing a system in a map, the Atlas Manager refers to the following list of services in the order shown in [Table 23-8](#). As soon as it associates the first service with the node, it displays it without looking for further matches. The icon may change if a service with a higher priority is detected later during discovery.

Table 23-8 *Atlas Manager Services*

Priority Number	Icon	Description
1.		NetWare server running the server management agent software
2.		Windows server running the server management agent software
3.		SFT III server running the MS engine
4.		Server running file server software
5.		Router running IP service
6.		Router running IPX service
7.		A switch or a bridge
8.		Server running the discovery process
9.		Server running the topology database
10.		NetWare or Windows server running the traffic analysis (Traffic Analysis) agent software
11.		Server running Remote Monitoring
12.		Server running Remote Monitoring II
13.		Server running print server software

Priority Number	Icon	Description
14.		Server running IP software
15.		Server running NetWare Connect software
16.		Router
17.		Printer
18.		IP workstation
19.		IPX workstation
20.		Others

If a system has either an IPX or IP router service, the Atlas Manager considers it a router and displays it on the appropriate pages and segments.

23.2 Setting Up Discovery

The discovery software on a management server automatically discovers the nodes on your network. Network nodes include servers, desktops, routers, hubs, switches, and any other network devices. The Consolidator on the server populates the database with the discovered data. The Atlas Manager on the server reads the database and creates the atlas.

Novell ZENworks Server Management allows discovery in two different environments:

- ◆ Pure IP environment
- ◆ IP/IPX environment

You must have IP enabled between Novell ConsoleOne and the management server.

Before starting discovery, you must verify the following configurations to ensure that the discovery system is complete:

- ◆ Ensure that the router to which Novell ZENworks Server Management server is attached is specified as the seed router in NXPCON. If necessary specify, additional IP routers also. For more information on specifying seed router and additional IP routers, see [“Specifying a Seed Router and Additional IP Routers” on page 910](#)

- ◆ Ensure that the community strings used for all the devices to be managed are specified in NXPCON. For more information on changing SNMP community strings, see [“Changing the SNMP Community String” on page 907](#).
- ◆ Ensure that the Novell ZENworks Server Management server is privileged to query the routers in your network if the routers are configured to restrict access to only specified IP addresses. For more information on IP router discovery, see [“IP router discovery on IP networks only.” on page 879](#).
- ◆ If you want to restrict the scope of IP or IPX discovery, specify proper scoping entries. For more information on changing the discovery scope, see [“Changing the Discovery Scope” on page 907](#).
- ◆ Ensure that the DNS configuration file, `sys:\etc\resolv.cfg`, has a valid DNS server's IP address. If a valid DNS server is not specified, discovery will fail to discover the DNS names of hosts.
- ◆ For effective discovery, ensure that the Traffic Analysis Agent is installed and running on each network segment that you want to discover and manage. Also, ensure that the names and addresses of these agents are specified in NXPCON. For more information on specifying Traffic Analysis Agents, see [“Specifying Traffic Analysis Agents to Be Queried by NXPLANZ” on page 910](#).
- ◆ If a MAC address is being associated with different network numbers, all such network numbers will be merged into a single segment. To avoid the merger, you must specify all such MAC addresses in upper case in the `installation_directory\mms\mwserver\bin\consolidator.ini` file.

In `consolidator.ini`, specify the MAC address as a key value pair in the `[DuplicateMacAddress]` section.

A sample `consolidator.ini` is as follows:

```
[DuplicateMacAddress]
mac1="00C04F59910D"
mac2="00C04F5991AB"
...
key_name=value
```

In `consolidator.ini`, ensure that the keys are unique.

Before starting the Novell ZENworks Management and Monitoring Services server, edit the `ZENworks_installation_directory\mms\mwserver\properties\sloader.properties` file to append the ARGUMENTS value under TOPOLOGY MANAGER with the following entry:

```
-ini "installation_directory\mms\mwserver\bin\consolidator.ini"
```

The following tasks will start discovery initially and help you customize discovery to meet your organization's needs:

- ◆ [Section 23.2.1, “Starting Discovery,” on page 904](#)
- ◆ [Section 23.2.2, “Checking the Status of Initial Discovery,” on page 904](#)
- ◆ [Section 23.2.3, “Checking the Results of Discovery,” on page 905](#)
- ◆ [Section 23.2.4, “Changing the Default Configuration,” on page 906](#)
- ◆ [Section 23.2.5, “Configuring the Java Processes,” on page 911](#)
- ◆ [Section 23.2.6, “Unloading the Management Server,” on page 913](#)

23.2.1 Starting Discovery

Discovery starts automatically when the discovery software is loaded on the management server.

To manually start autodiscovery and load the back-end services (management site services), refer to the steps in “[Management and Monitoring Services Installation](#)” in the *Novell ZENworks 7 Server Management Installation Guide*.

Restarting the Management Server

If you bring down the management server (for example, for maintenance), the restart affects discovery in the following ways:

- ◆ Each time you reload the discovery modules, a new version of `netexplor.dat` is created.
- ◆ The initial discovery cycle starts again.
- ◆ The Consolidator processes all the discovery data again as Novell ZENworks Server Management rediscovers the network.

To unload the discovery modules:

- 1 At the NetExplorer server, enter `unxp`.

To load the discovery modules:

- 1 At the NetExplorer server, enter `netexplor`.

23.2.2 Checking the Status of Initial Discovery

As discovery progresses, your topology maps in Novell ConsoleOne reflect the discovered data. However, in a large network, it might take a day or two before the initial discovery is complete.

The easiest way to determine whether initial discovery is complete is to use the NXPCON utility on the management server and check the status of each NetExplorer module. Each module must complete at least one full cycle to draw a complete map.

To view the discovery status, look at the discovery status fields at the top of the NXPCON screen. See “[Using the Discovery Configuration Utility](#)” on [page 906](#) for information about how to access this screen.

The NXPCON main screen gives you the information you can use to monitor the status of discovery.

The following information is displayed:

- ◆ **NetExplorer Up Time:** Shows the time since NetExplorer started running.
- ◆ **NetExplorer System Status:** Shows the overall status. It can have one of the following values:
 - ◆ Waiting to start - Waiting for one or more of the discovery modules to start.
 - ◆ Running - Discovery modules are running.
- ◆ **Module Status:** Shows the status of each module and the number of cycles each module has completed. The module status can be one of the following values:
 - ◆ Not Loaded - Module is not loaded.
 - ◆ Waiting to Start - Module is loaded but not started.
 - ◆ Running - Module is running and collecting data.

- ◆ Suspended - Module is suspended because it reached the end of the schedule in which it was running.
- ◆ Completed - Module completed a discovery cycle.
- ◆ Unknown - NetExplorer cannot obtain the module status. (This is usually seen if the module is not loaded.)

23.2.3 Checking the Results of Discovery

When the Consolidator has finished updating the database after the initial discovery, verify if the network topology is accurately represented on the maps.

NetExplorer might not have discovered the type if a node is not on the map. If a node does not appear in the correct segment, NetExplorer may not have received sufficient information to place it correctly. For more information, see [“What Is Discovered” on page 886](#). The following characteristics are captured:

- ◆ IP - Discovers IP routers; IP hosts; IP services such as HTTP, Telnet, SMTP, DNS, FTP; and DHCP.
- ◆ IPX - Discovers IPX workstations, IPX routers, and IPX services (file, print, any other Service Advertising Protocol [SAP]).
- ◆ Subnet mask
- ◆ Services
- ◆ Novell eDirectory names and tree
- ◆ DNS Names

The Consolidator on the management server communicates with NetExplorer to obtain network discovery data. The Consolidator reads the `netexplor.dat` file and populates the database.

IMPORTANT: The `netexplor.dat` file is reset every time you restart NetExplorer.

The Consolidator communicates with two Java* components: the Bridge Agent and the SN3 agent. The Bridge agent retrieves bridges present in the network and the related topology of the network. The SN3 agent does SLP-based discovery for NetWare 5.x servers and gets the corresponding Novell eDirectory name for each IP and IPX address discovered.

IMPORTANT: NetExplorer and the Consolidator can run independent of each other on the management server.

NetWare 5.x/6.x servers are discovered faster because NetWare 5.x/6.x supports the Service Location Protocol (SLP).

Ensuring Complete Discovery

IPX workstations are discovered with a username if the user is logged in to or attached to a NetWare server running management agent software. To ensure that the usernames for IPX devices and workstations on your network can be discovered, install a management agent on all NetWare servers where users log in.

If you want NetExplorer to discover AppleTalk* devices, you need to install the NetWare Traffic Analysis Agent on one server on each segment.

23.2.4 Changing the Default Configuration

The discovery software is installed with default configuration designed to work in most environments. However, if your network or the data on your database is not discovered, you need to reconfigure discovery.

Read the following sections for more information:

- ♦ “Using the Discovery Configuration Utility” on page 906
- ♦ “Choosing Which Discovery Modules to Load” on page 906
- ♦ “Changing the SNMP Community String” on page 907
- ♦ “Changing the Discovery Scope” on page 907
- ♦ “Specifying Traffic Analysis Agents to Be Queried by NXPLANZ” on page 910
- ♦ “Specifying a Seed Router and Additional IP Routers” on page 910
- ♦ “Refreshing the SNMP Configuration Settings of NetExplorer Using Activate Changes” on page 911

Using the Discovery Configuration Utility

You can use the NXPCON utility on the management server to change the discovery configuration. For example, you can change the scope of discovery or view the status of the initial discovery process.

To access the NXPCON utility:

- 1 Access the server console on the management server either directly from the server prompt or remotely.
- 2 If the discovery modules are already loaded on the server, click the *NetExplorer Console Utility* option in the Available Screens window.

or

If the discovery modules are not loaded, enter `netexplor` at the server prompt.

NXPCON is loaded automatically when NetExplorer is loaded and is accessible at the management server.

If NXPCON is not loaded on your management server, check to see if NetExplorer is running. If NetExplorer is running, enter `load nxpcon` at the system console prompt. If NetExplorer is not running, enter `netexplor` at the system console prompt.

Choosing Which Discovery Modules to Load

By default, the Novell ZENworks Server Management installation loads the NXPCON utility with all modules running. If you are not using IPX on your network, you can configure NXPCON to not load the NXIPX module.

IMPORTANT: Make sure TCP/IP is bound to at least one of your server's network boards.

To view or modify which modules are being loaded:

- 1 In NXPCON, click *Configuration Options > NetExplorer Modules*.

- 2 Select the field you want to change, then press Enter.
- 3 Select *Yes* or *No* to load or unload the module, then press Enter.
- 4 Press Esc to exit the NetExplorer Modules dialog box.
- 5 Click *Yes*.

You can enable IP host discovery or file-based discovery. To enable or disable:

- 5a Select *Configuration Options > IP Discovery*.
- 5b Select *IP Host Discovery* or *File Based Discovery*, then press Enter, then *Yes* to enable or *No* to disable the discovery option.
- 6 At the management server prompt, unload NetExplorer by entering `unxp`.
- 7 Reload the NetExplorer modules by entering `netexplor`.

Changing the SNMP Community String

In Novell ZENworks Server Management, the default community string is PUBLIC. If your organization's SNMP community string is not PUBLIC, reconfigure the SNMP community string in NXPCON.

NOTE: In order to prevent burdening the routers, some organizations add one more level of control by allowing only certain IP addresses to do SNMP queries to the routers. If this is true in your organization, make sure that the IP address given to the Novell ZENworks Server Management sever is privileged to query the routers in the network. Otherwise, the discovery will not be complete and incomplete network information will appear under "Islands" in the atlas.

To view, add, modify, or delete SNMP configuration information, such as community strings used for IP and IPX discovery:

- 1 In NXPCON, click *Configuration Options > SNMP*.
- 2 In the SNMP dialog box, click *Edit Community Name List*.
- 3 To add a community string, press Insert.
or
To modify a community string, click the community string, then press Enter.
or
To delete a community string, click the community string, then press Delete.
- 4 Press Esc, then click *Activate Changes* from the Configuration Options window. For more information about Activate Changes, see [“Refreshing the SNMP Configuration Settings of NetExplorer Using Activate Changes” on page 911](#).
- 5 Respond to the prompts accordingly.

For information about other configuration options in the SNMP window, see [“Using the Discovery Configuration Utility” on page 906](#), or Novell ConsoleOne online help.

Changing the Discovery Scope

By default, NXPCON is set to discover all IPX and IP networks. You can, however, limit the discovery scope.

You could, for example, limit discovery to discover the IPX addresses or the IP subnet addresses. If you are managing a large network, by setting the scope of discovery, you will be limiting the discovery to a section of your network, which will reduce the network traffic and in turn make your atlas more manageable

If you do not accurately specify the scope of discovery, you will not be able to discover your target device. Therefore it is imperative to specify in the scope, all the devices that are present in the path leading to the target device you want to discover.

For example, consider the following scenario.

Your discovery server D1 is connected to network N1. Router R1 connects network N2 with N1. Assume you need to discover network N2. To do this, the following entries need to be set in the scope:

- ♦ Discovery server D1 with subnet mask 255.255.255.255
- ♦ Router R1 with subnet mask 255.255.255.255
- ♦ Network N2 with its appropriate subnet mask number.

In this scenario, network N2 can be reached from the discovery server through Router R1, and therefore R1 needs to be in the scope even if the user is not interested in the network N1 that R1 is routing.

After initial discovery, until you reset the database, nodes remain in the database even if they have been removed from the network.

Changing the discovery scope does not affect devices that are already in the database due to prior runs of discovery. In particular, devices that were discovered due to a wider scope (or no scope) will not be removed when a restrictive scope is set for later runs of discovery. If it is desired that the atlas shows only those devices that fall in scope, the database needs to be reset to ensure that segments and devices that are out of scope do not appear in atlas. Note that the database being reset would result in loss of data like alarms and alarm disposition unless they are migrated. Alternatively, if the number of such devices which are out of scope is very small, the user can manually delete them from the database using the Database Object Editor.

You can restrict the scope of IP or IPX discovery by entering the IPX network numbers or IP address ranges specified by the mask fields you want to discover. To view or restrict the IP or IPX scope:

- 1 In NXPCON, from the Configuration Options window, click *Discovery Scope*.
- 2 Select *IP Discovery Scope* or *IPX Discovery Scope*.
- 3 Press Enter to view or configure the scope of your discovery.
- 4 Press Insert to add a new IP or IPX discovery scope entry.

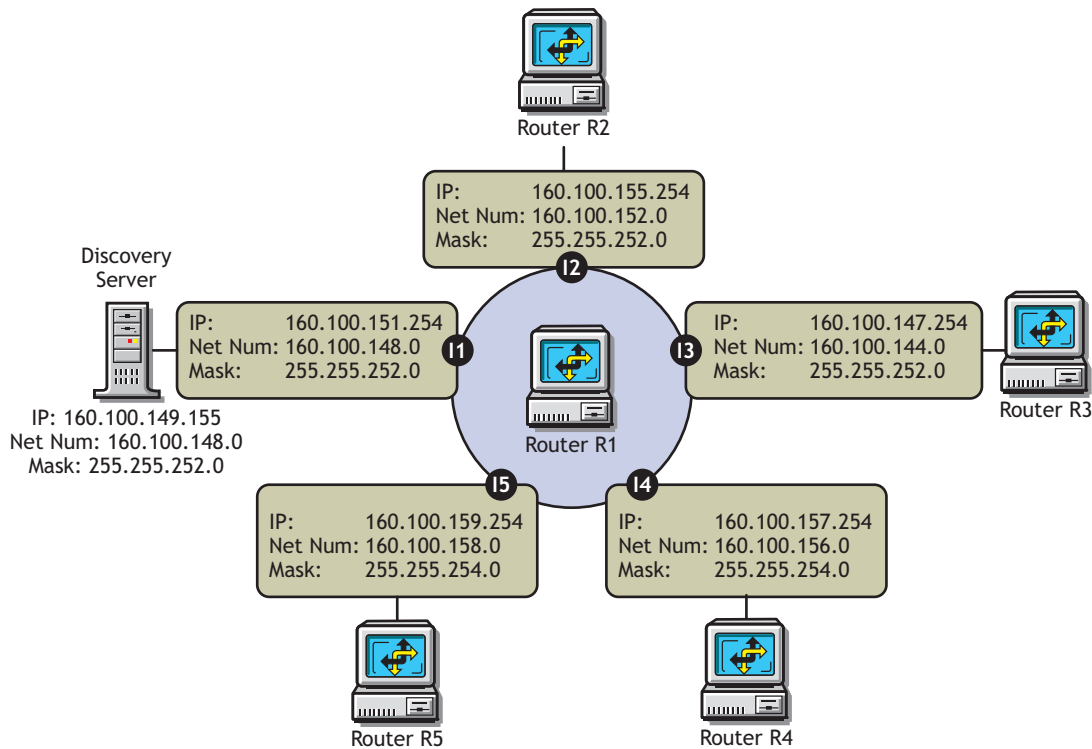

or

Press Enter to modify a discovery scope entry.

or

Press Delete to delete a discovery scope entry.

For IP Networks: Discovery scope is tightly bound to the network numbers. The scope can be restricted by specific networks as illustrated in the following diagram.

Case 1: To exclude 160.100.148.0 and discover the other four networks, specify the scope as:

160.100.149.155,255.255.255.255

160.100.151.254,255.255.255.255

160.100.144.0,255.255.252.0

160.100.152.0,255.255.252.0

160.100.156.0,255.255.254.0

160.100.158.0,255.255.254.0

The 255.255.255.255 mask for the Novell ZENworks Server Management server and the router interface on the local network acts as a machine specific scope. This prevents other machines in the network 160.100.148.0 from being discovered.

Case 2: To discover only the local network 160.100.148.0, specify the scope as:

160.100.148.0,255.255.252.0

The network 160.100.148.0 (Mask: 255.255.252.0) has IP addresses in the range 160.100.148.1 to 160.100.151.254.

Consider a case where all the important servers in your network have IP addresses in the range 160.100.149.1 to 160.100.149.254. You might specify the following scope:

160.100.149.0,255.255.255.0

The above scope is not allowed by the discovery system. You cannot set a scope to discover only a part of the subnet. You will have to set the entire subnet in scope.

Case 3: To discover only 160.100.156.0 and 160.100.158.0 scope should be given as:

160.100.149.155,255.255.255.255

160.100.151.254,255.255.255.255

160.100.156.0,255.255.254.0

160.100.158.0,255.255.254.0

Replacing the last two scoping entries with a single entry 160.100.156.0,255.255.252.0 might not have the same effect.

You cannot create a single scoping entry to cover two or more subnets. You have to create a scope for each subnet.

For IPX Networks: Restrict the scope to the IPX networks to be discovered by entering a single IPX network number and a mask.

The mask indicates which part of the network number needs to match. An F in the mask means that the corresponding digit must match; a 0 (zero) means that no match is required.

For example, network number 12340000 and mask FFFF0000 will match any network number starting with 1234.

Network number C00000FF and mask FF0000FF will match any network number starting with C0 and ending with FF, such as C01234FF or C00000FF.

- 5 Enter the address and mask for your discovery scope.
- 6 Press Esc, then click *Yes* to save changes to the configuration file.
- 7 Press Esc to return to the Discovery Scope window.
- 8 Unload and reload the NetExplorer modules or restart your management server for the changes to take effect.

Specifying Traffic Analysis Agents to Be Queried by NXPLANZ

Traffic analysis agents in your network are usually discovered by the NXPLANZ module. If SLP is disabled or if SAP packets are filtered by the routers in your network, NXPLANZ might not be able to discover all the Traffic Analysis Agents in the network.

To specify Traffic Analysis Agents to be queried by the NXPLANZ module:

- 1 In NXPCON, click *Configuration Options > NXPLANZ Discovery*.
- 2 To add an agent, press Insert.
- 3 Enter the address and mask for your discovery scope.
- 4 Press Esc, then click *Yes* to save changes to the configuration file.
- 5 Unload and reload the NetExplorer modules or restart your management server.
- 6 To modify an agent, select the agent, then press Enter. Modify the required information.
- 7 To delete an agent, select the agent, then press Delete.

Specifying a Seed Router and Additional IP Routers

Seed router is the router to which Novell ZENworks Server Management server is connected. For router discovery to be effective, always specify the seed router using NXPCON and ensure that Novell ZENworks Server Management server can query the seed router by specifying the proper community name in NXPCON.

You need to specify additional IP routers if you want to discover one part of your network and the Novell ZENworks Server Management server does not have access to one of the intermediate routers.

To specify a seed router or additional IP Routers:

- 1 In NXPCON, click *Configuration Options > IP Discovery > IP Router Discovery*.
The default for IP Seed Router is *<local>*, which is the Novell ZENworks Server Management server.
- 2 To add a seed router, select *IP Seed Router* and press Enter.
- 3 Enter the IP address.
- 4 To add additional routers, select *Additional IP Routers* and press Enter.
- 5 Enter the IP address.
- 6 Press Esc, then click *Yes* to save changes to the configuration file.
- 7 Unload and reload the NetExplorer modules or restart your management server.

Refreshing the SNMP Configuration Settings of NetExplorer Using Activate Changes

When you change the SNMP configuration settings of NetExplorer (such as the SNMP community string), the NetExplorer can be automatically updated with the changes without restarting NetExplorer. To automatically update NetExplorer with new settings, select *Activate Changes* from the Configuration Options window of NXPCON.

However, if you change any other configuration options of NXPCON (for example, the Discovery Scope), you must restart NetExplorer for these changes to be applied on NetExplorer. For more information on how to restart NetExplorer, see [“Stopping and Starting the Discovery NLM Files” on page 912](#).

23.2.5 Configuring the Java Processes

The following are the three Java processes of the discovery system:

- ♦ Topology Manager
- ♦ Bridge Discovery
- ♦ SN3 Discovery

These Java processes form a part of the Management Site Server and exist as sections in the `sloder.properties` file in the `installation_path\novell zenworks\mms\mwserver\properties` directory. They are specified in the following format:

```
[Topology Manager]
Name = Topology Manager
Load Option = auto
Other options
```

To configure the Java processes:

1. Change the value of the Load Option from Auto to Manual to prevent the process from starting the next time you enter the SLOADER command on the server.

IMPORTANT: If you modify the `sloader.properties` file after you start the Management Site Server, you must restart the Management Site Server for the changes to take effect.

2. Do not change the Load Properties and the Load Sequence options in the `sloader.properties` file. These options are necessary for the Management Site Server to work correctly.

Customizing Starting and Stopping Discovery

You can choose to stop or start the discovery NLM files or the Java discovery processes without affecting the other services of the site server, such as the Alarm Manager Service.

Stopping and Starting the Discovery NLM Files

To stop the discovery NLM files, enter `UNXP` at the server console.

To start all the discovery NLM files, enter `NETXPLORE` at the server console.

NOTE: You cannot start the Discovery NLM files if the Java processes are running. Stop the Java processes and then enter `NETXPLORE` at the server console to start all the discovery NLM files.

Stopping and Starting the Java Discovery Services

To stop the discovery NLM files, enter `STOPDIS` at the server console.

To start all the discovery NLM files, enter `STARTDIS` at the server console.

You can customize starting or stopping any of the Java discovery processes at any point in time. For example, you decided not to run the Bridge discovery initially but decide to run it anyway. In such a scenario, you need not stop all the services and restart them.

You can edit the `startdis.ncf` file in the `\Novell ZENworks\mms\mwserver\bin` directory, which has the following contents:

```
MWSETENV.NCF
```

```
java -Xbootclasspath/p:$mwxbpath -classpath
$MMSCP;%CLASSPATHcom.novell.utility.servicemanager.ui.Start "Topology
Manager" "Bridge Discovery" "SN3 Discovery" <ip address of the server> sloader
```

In the above file, the Java discovery process names like SN3 Discovery must match the names of the sections in the `sloader.properties` file. By changing just the names in the NCF files, you can create similar NCF files to selectively stop and start the Java discovery services.

For example, if you want to start just the Bridge discovery process:

1. Create a `startbri.ncf` file with the following contents:

```
mwsetenv.ncf

java -Xbootclasspath/p:$mwxbpath -classpath
$MMSCP;$CLASSPATHcom.novell.utility.servicemanager.ui.Start "Bridge
Discovery" <ip address of the server> sloader
```

2. Copy the `startbri.ncf` file to the `\novell zenworks\mms\mwserver\bin` directory.
3. Run the `startbri.ncf` file to start the Java discovery bridge service.

For example, to stop the Java discovery process for the SN3 Agent:

1. Create a `stopasn3.ncf` file with the following contents:

```
mwsetenv.ncf

java -Xbootclasspath/p:$mwxbpath -classpath
$MMSCP;$CLASSPATHcom.novell.utility.servicemanager.ui.Stop "SN3 Discovery"
<ip address of the server> sloader.
```

23.2.6 Unloading the Management Server

To unload the management server:

- 1 If restarting the server is not feasible, make sure all Service Loader processes are exited. At the server console prompt, enter

```
stopService.ncf
```

This process might take some time to unload the services.

To know the status of “com.novell.zfs.mms.utility.servicemanager.zfs_MMS_Services” and “com.novell.zfs.mms.utility.servicemanager.zfs_MMS_LanzSlpDis,” enter `java - show` at the server console prompt.

You can use `java -exit` if you can terminate all other Java processes. Unload Java, if all the services are not closed.

- 2 If you are not running any other components of ZENworks 7 Server Management or ZENworks 7 Desktop Management that use the naming server, enter `stopmms -n` to unload all ZENworks 7 Server Management components.
- 3 Switch to the Sybase* process by pressing Ctrl+Esc then enter `q` to terminate the Sybase database engine.

23.3 Managing the Atlas

After the initial discovery, you can stop discovery running on the management server. You can, however, continue to access the database through the Atlas Manager. The discovery cycle starts again the next time NetExplorer is up. The Consolidator populates the database and the Atlas Manager automatically updates the atlas pages.

Depending on the size of your network, writing data from the initial discovery cycle can take few minutes to several days. Subsequent discovery updates to the database require substantially less time.

- ◆ [Section 23.3.1, “Using the Atlas,” on page 914](#)
- ◆ [Section 23.3.2, “VLAN Atlas,” on page 920](#)
- ◆ [Section 23.3.3, “Using Unified Views,” on page 921](#)

23.3.1 Using the Atlas

When Novell ZENworks Server Management is first installed, the server module of the Atlas Manager is automatically installed on the management server, and the client module of the Atlas Manager is installed on Novell ConsoleOne. The Atlas Manager on the management server creates a system atlas and provides a graphical view of the database at the console.

The Atlas Manager on the server reads the database and provides two different views of the database at Novell ConsoleOne: the Console view and Atlas view. Both views provide information about the discovered network topology, the physical location of nodes, node configuration information, and alarm information.

The following sections gives you an understanding about using the atlas:

- ◆ [“Accessing the Atlas” on page 914](#)
- ◆ [“Assigning Roles to Help You Manage the Atlas” on page 915](#)
- ◆ [“Using the Atlas to Troubleshoot” on page 915](#)
- ◆ [“Custom Maps” on page 916](#)
- ◆ [“Node Naming Order” on page 919](#)

Accessing the Atlas

You can access the Novell ZENworks Server Management atlas from Novell ConsoleOne. Open Novell ConsoleOne and double-click the Novell ZENworks Server Management Domains namespace, then expand the domain. The system atlas appears.

[Table 23-9](#) describes a Novell ZENworks Server Management atlas consisting of three different pages:

Table 23-9 *Three-page Atlas*

Atlas Pages	Icon	Description
WAN page		Summarizes the entire network, illustrating the WAN-related network topology. Your atlas, typically, has a single WAN page.
Area page		Displays segments on your network. An atlas can have several area pages. For example, areas can be divided based on the geographic location of the network. If a company in San Jose has an overseas branch in Germany, you can divide your network into Area1 for the San Jose network and Area2 for the Germany network.

Atlas Pages	Icon	Description
Islands page		Consists of segments with an undetermined connectivity. During discovery, the Islands page is a placeholder for network objects that are not completely discovered. An atlas has a single Islands page.

Customizing Your Atlas View

You can customize your atlas view in three different ways:

- ◆ Insert a custom bitmap as the background on an atlas page.
- ◆ Change the position of a node on an atlas page by dragging it.
- ◆ Display objects by an alternate name.

Assigning Roles to Help You Manage the Atlas

Novell ZENworks Server Management lets you assign roles to manage the atlas. By assigning roles, you can restrict the user from performing specific operations on that object.

TIP: The atlas displays maps based on your role on the network. For example, if your role is restricted to managing certain servers in segment A and B, your atlas will contain only those servers in segments A and B.

You can perform the following tasks on any atlas page (WAN, Islands, or Area page) when the Atlas view is displayed on Novell ConsoleOne:

Table 23-10 Tasks that can be performed on an Atlas page

Tasks	Comments
Open	Opens the page
Import	Inserts a custom wallpaper
Save	Updates the changes in the database
Print	Prints the page
Rename	Renames the page
Layout	Displays the page with a different focal point

Using the Atlas to Troubleshoot

By setting the alarm disposition to save alarms in the database, Novell ZENworks Server Management maps can alert you to alarm conditions on the network. Alarms are of type severe, major, or minor alarm on a segment or node. Upon recognizing any of these alarms, the ConsoleOne displays different colors above the object depending on the severity of the alarm as shown in [Table 23-11](#):

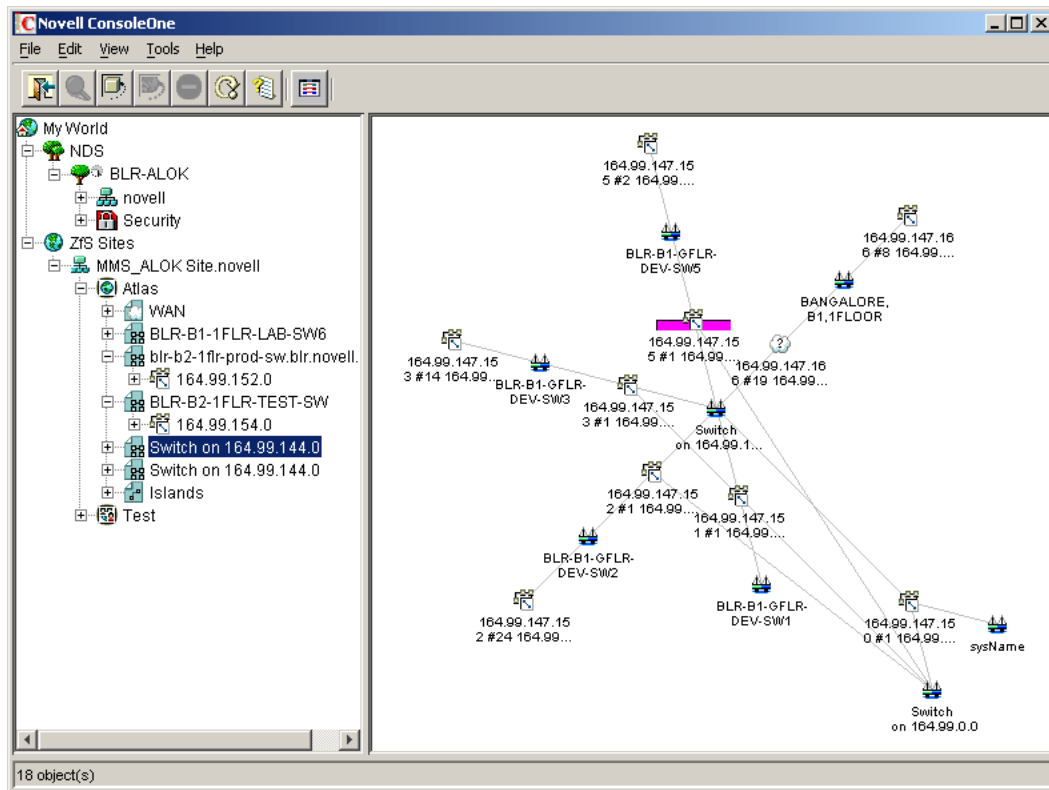

Table 23-11 Alarm Severity

Color	Severity of Alarm
Red	Sever
Pink	Major
Yellow	Minor

The alarm status is propagated up the hierarchy. For example, if a server has an alarm of type severe, the segment and the page containing the server will display the corresponding alarm icon. For information about alarms, [Section 24.2, “Managing the Alarm Management System,” on page 928](#).

[Figure 23-16](#) shows the atlas namespace in ConsoleOne:

Figure 23-16 Atlas namespace in Novell ConsoleOne

Custom Maps

Custom Maps enable you to create and delete custom atlases and custom containers and group nodes into containers. You can also create a hierarchy of objects in atlas. An atlas can contain custom containers. you can create a node or a sub container within the custom container. However nodes cannot be directly contained under the atlas.

You can perform the following operations in the custom atlas:

- ♦ [“Creating a Custom Atlas” on page 917](#)
- ♦ [“Creating a Custom Container” on page 917](#)

- ♦ “Adding Nodes to the Container” on page 917
- ♦ “Renaming the Custom Atlas Objects” on page 918
- ♦ “Deleting Custom Atlas Objects” on page 918
- ♦ “Locating Nodes in the Custom Atlas” on page 918
- ♦ “Locating All Occurrences of the Nodes” on page 918
- ♦ “Copying Nodes to a Custom Container” on page 919

Creating a Custom Atlas

- 1 Right-click the site object where you want to create the custom atlas, then click *New > Atlas*.
- 2 Specify the name of the atlas.
- 3 Click *OK*.

Creating a Custom Container

You can create a custom container within a new custom atlas. You can also create a subcontainer within a container.

- 1 Right-click the custom atlas you created, then click *New > Container*.
or
In the right-pane of Novell ConsoleOne, right-click the custom container you created, then click *New > Container*.
- 2 Specify the name of the container.
- 3 Click *OK*.

Adding Nodes to the Container

You can associate multiple nodes to a container.

- 1 Right-click the custom container you created, then click *Add Nodes*.

- 2 Select the nodes you want to add to the container.
- 3 Click *Select*.
The selected nodes are displayed in the *Selected Objects* list.
- 4 Click *OK*.

Renaming the Custom Atlas Objects

- 1 Select the atlas object you want to rename.
- 2 Click *Rename*.
- 3 Specify a new name.
- 4 Click *OK*.

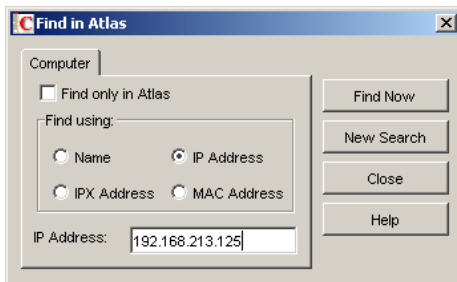

Deleting Custom Atlas Objects

- 1 Select the atlas object you want to delete.
- 2 Click *Delete*.

Locating Nodes in the Custom Atlas

You can locate particular node in the specific atlas or across all the atlases that are present. To locate nodes in the same atlas, select the Find only in *atlasname* check box. If you do not select this check box, then the node will be located in all the atlases.

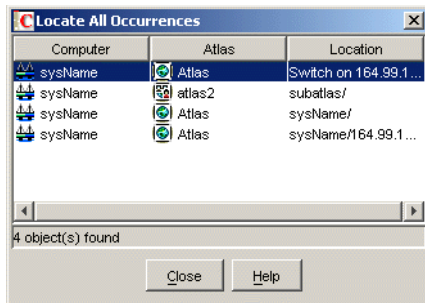

Figure 23-17 Find in Atlas Dialog Box

- 1 Right-click the custom atlas, click *Find*.
- 2 Specify the conditions to base your search on.
- 3 Click *Find Now*.
The location of the network object in the custom atlas is displayed in a list in the Find In Atlas dialog box.
- 4 To jump to the location of the node, double-click the node.
- 5 Click *Close*.

Locating All Occurrences of the Nodes

- 1 Right-click the node whose occurrences you want to locate, then click *Locate All Occurrences*.
The occurrences of the nodes are displayed in the Locate All Occurrences dialog box.

- 2 To jump to the location where the node exists, double-click the node.
- 3 Click *Close*.

Copying Nodes to a Custom Container

You can copy nodes to the custom container you have created.

- 1 Select the nodes you want to copy, then right-click and select *Copy to Container*.
- 2 In the Select Objects dialog box, locate the custom container where you want to copy the nodes to.
- 3 Click *OK*.

Node Naming Order

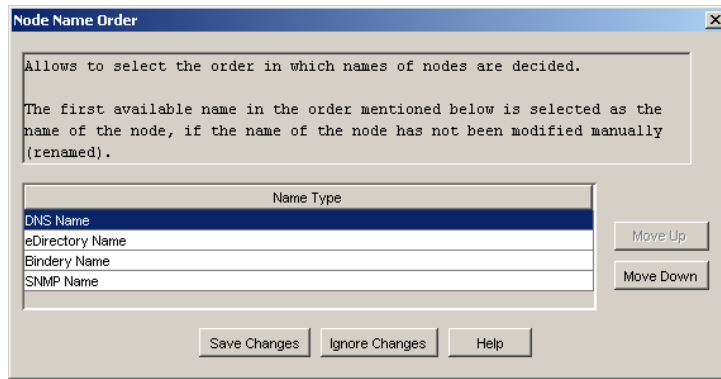

As discovery cycles proceed and more information is discovered, the names displayed in the maps can change. Different priorities are given to names, depending on the source of the name information. If none of the names are discovered, the IP/IPX address of the node is displayed as the node name.

To determine how to display the name of the discovered object, the Atlas Manager uses the following list in the order shown:

- ♦ User - defined name
- ♦ DNS Name
- ♦ Novell eDirectory Name
- ♦ Bindery Name
- ♦ SNMP Name

Use the Node Name Order dialog box to change the order of display.

- 1 At the atlas level, select *File > Node Naming Order*.

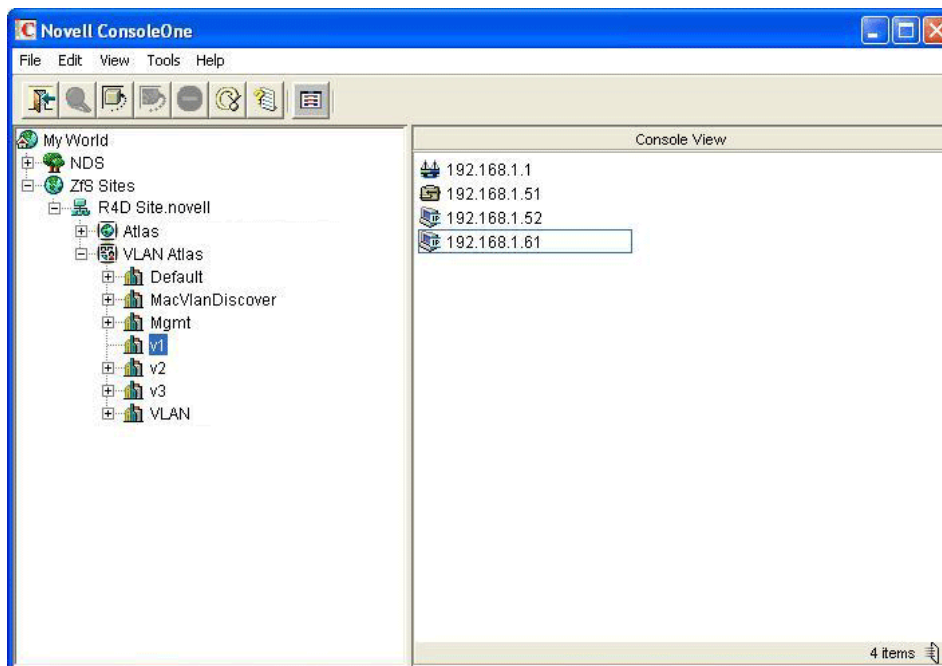

2 Use the following options:

- ◆ **Move Up:** Changes the order of the node names.
- ◆ **Move Down:** Changes the order of the node names.
- ◆ **Save Changes:** Saves the changes you made.
- ◆ **Ignore Changes:** Ignores the changes you made.

23.3.2 VLAN Atlas

VLAN Atlas provides a logical view of all VLANs present in the network. VLAN feature uses the custom atlas framework to create a VLAN-specific atlas.

Under VLAN atlas, you can see all the networks running on different VLANs.

The naming convention for the VLANs is VLAN_name. All the machines belonging to a particular VLAN, are placed in respective containers. The assumption made is that, in a given organization the names of VLANs are distinct.

Because VLAN Atlas is a custom atlas, all the operations that are possible in a custom atlas are possible for VLAN Atlas as well. However, renaming or deleting a container is not possible.

Only port-based VLANs are currently supported on Baystack, Extreme, and Cisco switches.

23.3.3 Using Unified Views

The Unified view service is a service that acts as a filter on the atlas. Using the Unified view, you can filter for a list of devices or segments of a particular type. The Unified view allows easy navigation and quick operations to check the highest severity of the alarms present on a particular node or segment.

The following are the two types of Unified view provided:

- ◆ “Unified View for Devices” on page 921
- ◆ “Unified View for Segments” on page 922

Unified View for Devices

You can view All, Manageable, or Unmanageable devices in this view. For a corresponding device type, a device is said to be manageable if the list of MIBs implemented by the device satisfies the `Manageability_definition` property in the `unifiedview.ini` file in the `novell zenworks\mms\mwserver\bin` directory. The `Manageability_definition` property can be updated with a valid boolean expression of MIB names.

Following are the device types that you can filter:

- ◆ All (all types of devices)
- ◆ NetWare Servers
- ◆ NCP Print Servers
- ◆ TCP Services
- ◆ Printers
- ◆ IP Routers
- ◆ Switches/Bridges
- ◆ IPX Routers
- ◆ Windows Servers

To filter the devices:

- 1 In the atlas, select *View > Unified View for Devices*.
- 2 From the first drop-down list, select *All* to list all the devices.
or
Select *Manageable* to list the manageable devices.
or
Select *Unmanageable* to list the unmanageable devices.
- 3 From the second drop-down list, select a device type.
- 4 Click *Show*.

The Unified view will display the list of the devices. The tabular column in the Unified view contains the following information:

- ♦ The icons associated with the devices.
- ♦ The MIBs implemented by the device. If the device does not implement any MIBs the column will specify “No MIBs implemented” for that device.
- ♦ The maximum severity of the alarms against the devices. To view the legend for the alarm, select the alarm legend button on the toolbar.

Unified View for Segments

You can view All, Manageable, or Unmanageable segments in this view. For a corresponding segment type, a segment is said to be manageable if the list of MIBs implemented by at least one device in that segment satisfies the `Manageability_definition` property in the `unifiedview.ini` file. The `Manageability_definition` property can be updated with a valid boolean expression of MIB names.

The following are the segment types you can set filter for:

- ♦ All (all types of segments)
- ♦ Ethernet
- ♦ Frame Relay
- ♦ IPX Compatibility Mode
- ♦ Token Ring
- ♦ X.25
- ♦ PPP
- ♦ ATM
- ♦ FDDI

To filter the segments:

- 1** At the Atlas level, select *View > Unified View for Segments*.
- 2** From the first drop-down list, select *All* to list all the segments.
or
Select *Manageable* to list the manageable segments.
or
Select *Unmanageable* to list the unmanageable segments.
- 3** From the second drop-down list, select a segment type.
- 4** Click *Show*.

The Unified view will display the list of the segments. The tabular column in the Unified view contains the following information.

- ♦ The icons associated with the segments.
- ♦ The name of the segment.
- ♦ The maximum severity of the alarms against the segments. To view the legend for the alarm, select the alarm legend button on the toolbar.

Understanding Alarm Management

The Novell® ZENworks® Server Management Alarm Management System alerts you to important events like the SNMP traps, threshold alarms, and ping and connectivity testing faults occurring on your network. This lets you proactively resolve network problems and receive updates on events occurring on your network.

Alarm icons are anchored to objects displayed in Novell ConsoleOne®. The icons change color to depict the level of severity, notifying you of potential problems. The events are reported in the Active Alarm view, and each event is categorized and displayed with a corresponding alarm icon.

The Alarm Management System processes any device on the network that supports SNMP-standard trap notification. For example, for all Novell NetWare® servers on which the Management Agent for NetWare is installed, notifications of server breakdowns, overloads, and configuration changes are sent to the management server for processing and then made available for viewing at a Novell ZENworks Server Management Novell ConsoleOne.

You can enable and disable alarms and set alarm thresholds on baseline statistics for segments and servers (for example, segment alarms for utilization and the total number of packets per second), so that an alarm is generated when the threshold for a statistic is reached. You can also set actions to be performed when an alarm occurs. The actions assigned to an alarm are specified in the alarm rule.

This section contains the following topics:

- ♦ [Section 24.1, “Understanding the Alarm Management System,” on page 923](#)
- ♦ [Section 24.2, “Managing the Alarm Management System,” on page 928](#)
- ♦ [Section 24.3, “Managing the Rule-Based Alarm Management System,” on page 939](#)
- ♦ [Section 24.4, “Maintaining the Alarm Management System,” on page 956](#)
- ♦ [Section 24.5, “Troubleshooting the Alarm Management System,” on page 956](#)

24.1 Understanding the Alarm Management System

The Alarm Management System alerts you to network conditions and events. It provides you with tools and back-end services to use, distribute, and manage this information. The Alarm Management System component is also fully integrated with other Novell ZENworks Server Management components. It provides access control through the Role-Based Services component and provides report generation through the reporting functions. The Alarm Management System provides a centralized location for processing and viewing the events and alarms generated by devices and systems throughout your network.

You can use ConsoleOne to view tabular lists of statistical data for active and historical alarms received by the Alarm Management System. This makes it easy to handle alarms and track network events and recurring alarm conditions.

In addition, real-time notification of alarms occurring on your network is provided by the following:

- ◆ Severity level, as displayed by the changing color of the alarm indicators
- ◆ Audible notification
- ◆ Status bar ticker-tape messages

You can also assign an action to an alarm, such as automatically launching a program when an alarm is received, or sending an e-mail message to notify remote users of events.

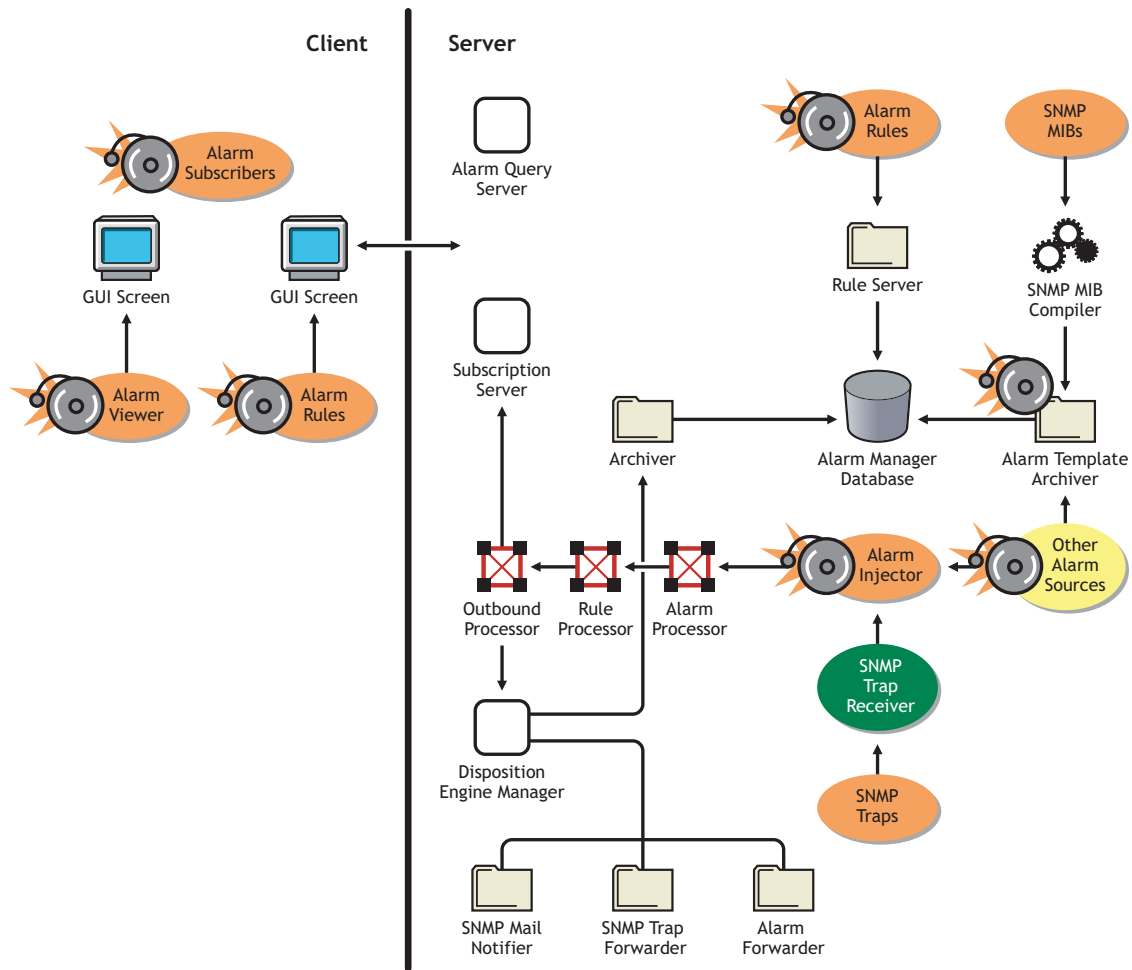

- ◆ [Section 24.1.1, “Alarm Management System Components,” on page 924](#)

24.1.1 Alarm Management System Components

The Alarm Management System consists of multiple components for processing, storing, and viewing alarms. All alarms received by the Alarm Management System are processed and sent to applications that subscribe to them. ConsoleOne, by default, subscribes to the Alarm Management System and receives updates when an alarm is processed. Hierarchical Status Notification also subscribes to the Alarm Management System and changes the color of the atlas map icon accordingly.

[Figure 24-1](#) illustrates the Alarm Management System components:

Figure 24-1 Alarm Management System components on the client and on the server

The main components that make up the Alarm Management System are as follows:

- ◆ “SNMP Trap Receiver” on page 925
- ◆ “Alarm Server” on page 926
- ◆ “Alarm Processors” on page 926
- ◆ “Rule Processor” on page 926
- ◆ “Outbound Processor” on page 926
- ◆ “Disposition Engine Manager” on page 926
- ◆ “Alarm Manager Database” on page 926
- ◆ “Archivers” on page 927
- ◆ “Alarm Viewers” on page 927

SNMP Trap Receiver

The SNMP Trap Receiver receives traps from network management agents and converts them to alarms. Thereafter, it passes them to the Alarm Server.

Alarm Server

The Alarm Server receives alarms from the SNMP Trap Receiver and other applications. Then it passes them to the alarm processors.

Alarm Processors

The Alarm Processors include processes for receiving, processing, and dispatching alarms to various subscribers. The inbound processor applies alarm templates to incoming alarms. After inbound processing is completed, the alarm is sent to the LSM Hook Processor, which processes segment-related alarms. The LSM Hook Processor sends the alarm to the Rule Processor.

Rule Processor

The Rule Processors applies all the configured rules on the alarm it has received from the LSM Hook Processor. If the alarm satisfies any of the rules, corresponding disposition information is updated and the alarm is sent to the Outbound Processor. If none of the rules satisfies by the alarm, the alarm is dropped.

Outbound Processor

After receiving the alarm from the Rule Processor, Outbound Processor sends the alarm to the Disposition Engine Manager and all the subscribers of the alarm manager.

Disposition Engine Manager

The Disposition Engine Manager checks the Actions defined in the alarm it has received and sends the alarms to respective disposition engines such as the SNMP Trap Forwarder, Alarm Forwarder, Archiver, and SMTP Mail Notification.

Alarm Manager Database

The alarm manager database, a repository for alarm information, includes the following:

- ♦ [“Processed Alarms” on page 926](#)
- ♦ [“Alarm Templates” on page 926](#)
- ♦ [“Alarm Rules” on page 927](#)

Processed Alarms

The processed alarm data that is stored in the alarm manager database is supplied to ConsoleOne through the alarm query server. The alarm data is used for alarm and alarm summary presentation and reporting.

Alarm Templates

Alarm Templates are applied to each alarm received by the inbound processor. The alarm template is based on SNMP trap definitions in the MIB or other proprietary definitions for handling the Alarm Management System management and display criteria. When you compile the MIB, the trap definitions are used to create an alarm template that provides a method for presenting and managing alarm data. Proprietary alarm templates are based on proprietary definitions.

For example, when a user tries to log in to a server with an incorrect password, an alarm is generated and forwarded to the management server. The management server processes the alarm by identifying the trap object identifier (OID) and assigns the associated alarm template.

A default template is assigned to an SNMP trap sent by a device that does not have a recognizable OID and is categorized as unknown. In order for a trap OID to be recognized by Alarm Management System, you need to compile the MIB of the device into the MIB Pool on the management server.

Alarm Rules

Alarm Rules govern the handling characteristics of SNMP traps or proprietary alarms. Each Alarm Rule contains a set of Conditions and Actions. For example, Source address, Alarms, Severity, State, and Time Interval are Conditions and Sending SMTP Mail Notification, Trap Forwarding, Archiving, Launching Applications, and Automatic Assignment to User are Actions. An alarm can only satisfy a Rule when it complies to all Conditions and Actions specified in the Rule. When an alarm satisfies a rule, the Actions defined in the Rule perform the specified operations on the alarm.

Archivers

The following three archivers add data to the alarm manager database:

- ♦ [“Alarm Archiver” on page 927](#)
- ♦ [“Rule Server” on page 927](#)
- ♦ [“Template Archiver” on page 927](#)

Alarm Archiver

The alarm archiver stores alarm statistics and data in the alarm database. By default, all alarms are archived. If you do not want an alarm to be archived, you can disable the default rule. See [“Archiving Alarm Statistics” on page 949](#) for more information.

Rule Server

The Rule Server receives the alarm rule from the Alarm Rule Console and saves it in the alarm manager database.

Template Archiver

The template archiver receives alarm templates from a MIB compiler and saves them in the alarm manager database.

Alarm Viewers

ConsoleOne displays three views of alarm data: the Active Alarm view, the Historical Alarm view, and the Alarm Summary view.

The Active Alarm view displays statistics in ConsoleOne for events occurring on your network. Alarms displayed in the Active Alarm view can either be owned by you or assigned to a group. The tasks that you can perform on an alarm from this view depend on the access rights allowed through the Role-Based Services. The Active Alarm view appends incoming alarms to the list, providing you with the most recent alarms. After an alarm is handled, it is removed from the Active Alarm list.

The Alarm History view displays information about assignments and ownership of alarms. You can track alarms received by the Alarm Management System and verify their handling status from this view.

The Alarm Summary view is a graphical representation of all the alarms that you have received.

24.2 Managing the Alarm Management System

ConsoleOne provides a central location for monitoring, managing, and controlling critical events on your network. You can configure the Alarm Management System to alert you to errors on critical systems and events to assist you in maintaining your network. This section contains the following information:

- ◆ [Section 24.2.1, “Recognizing Alarm Indicators,” on page 928](#)
- ◆ [Section 24.2.2, “Viewing Alarms,” on page 929](#)
- ◆ [Section 24.2.3, “Enabling and Disabling Alarms,” on page 933](#)
- ◆ [Section 24.2.4, “Resolving Alarms,” on page 933](#)
- ◆ [Section 24.2.5, “Deleting Alarms,” on page 935](#)
- ◆ [Section 24.2.6, “Performing Actions on Alarm Templates,” on page 937](#)

24.2.1 Recognizing Alarm Indicators

You can monitor the network for alarm-triggering events by observing nodes on topology maps or Atlas views, [Active Alarm](#), and [Alarm History](#) views, and in the server/node summary. [Table 24-1](#) lists the alarm indicators and the type of alarm they are associated with:

Table 24-1 Alarm indicators and its associated Alarm type

Alarm Indicator	Applies To
Alarm icons anchored to the affected object	Severe, major, and minor alarms are displayed in the Atlas and Console views and the left pane of ConsoleOne. An alarm icon remains anchored to a segment or device object until you handle all alarms outstanding against that object. Alarm icons differ based on the severity level of the alarm. See “Interpreting Alarms” on page 930 for details on alarm severity and the associated icons. If a segment or device has multiple alarms logged against it, the alarm icon always depicts the highest level of severity.
Ticker-tape message on the status bar	By default, the Alarm Management System automatically displays alarm messages on the status bar. You can enable or disable this ticker-tape display for each severity level. For information on configuring this option, see “Displaying a Ticker-Tape Message” on page 950 .
Audible beep	The Alarm Management System can be configured to produce an audible beep on ConsoleOne when an alarm occurs. By default, this option is disabled. You can configure each individual severity level to enable the audible notification. For information on setting this option, see “Beep On Console” on page 950 .

24.2.2 Viewing Alarms

You can access active and historical alarm data from any ConsoleOne location. As an administrator, you can define access restrictions to alarm data and management functions through Role-Based Services to further define the data presented based on the roles in your organization.

You can modify the presentation of the alarm data displayed in the Active Alarms and Alarm History view by filtering the displayed data, changing the column layout, and changing the sorting order. All options for changing the presentation are under the View menu in ConsoleOne.

The following sections describe the different ways you can view and use alarms:

- ♦ [“Viewing Active Alarms” on page 929](#)
- ♦ [“Viewing Historical Alarms” on page 929](#)
- ♦ [“Viewing the Alarm Summary” on page 930](#)
- ♦ [“Interpreting Alarms” on page 930](#)
- ♦ [“Sorting Alarms” on page 931](#)
- ♦ [“Filtering Alarms” on page 932](#)

Viewing Active Alarms

The ConsoleOne Active Alarm view displays alarm statistics for all current alarms received from segments or devices, per management domain. The Summary view shows a list of all active alarms for that server or node.

The Active Alarms view and Server Summary view display a table of detailed information about active alarms. These views are updated whenever a new alarm occurs and is archived on your network. New alarms are appended to the list.

To display the Active Alarm view:

- 1 In ConsoleOne, select the Novell ZENworks Server Management site object.
- 2 Click *View > Active Alarms*.

The Active Alarm view is displayed. You can perform the following activities from this view:

- ♦ [“Assigning Alarms” on page 934](#)
- ♦ [“Owning Alarms” on page 934](#)
- ♦ [“Handling Alarms” on page 935](#)
- ♦ [“Adding Notes to Alarms” on page 935](#)

Viewing Historical Alarms

The Alarm History view displays information about all archived alarms, including the handling status of each alarm. You can access the Alarm History view only if you have been granted access through the Role-Based Services.

To display the Alarm History view:

- 1 In ConsoleOne, select the Novell ZENworks Server Management site object.
- 2 Click *View > Alarm History*.

The Active Alarm view is displayed. You can perform the following alarm handling activities from this view:

- ◆ “Assigning Alarms” on page 934
- ◆ “Owning Alarms” on page 934
- ◆ “Deleting Alarms” on page 935
- ◆ “Adding Notes to Alarms” on page 935

Viewing the Alarm Summary

The Alarm Summary is a graphical representation of the summary of alarms you have received. The view is divided into three panels: a pie chart panel, a bar graph panel, and a trend panel. You can choose to view the information in these panels for a given period of time. The time duration is for the hour, for the day, for the week, and for the month.

- ◆ The pie chart panel includes alarm distribution based on severity, category, owner, and alarm state
- ◆ The bar graph panel includes the Top N Alarm types, Top N Source Address and Top N Affected Node. The value of N is configurable.
- ◆ The trend displays the rate at which the alarms are received.

You can customize the pie chart and the bar graph representations to reflect the customized data.

To display the Alarm Summary view:

- 1** In ConsoleOne, select the Novell ZENworks Server Management site object.
- 2** Click *View > Alarm Summary*.

To customize the pie chart and the bar graph representation:

- 2a** In the Alarm Summary view, click the *Customize* button to display the Customize Summary View dialog box.

By default, all the options in this dialog box are selected. You can select to display only the options you want.

Interpreting Alarms

The Active Alarm and Alarm History views display lists of alarms that have been archived in the alarm manager database. The alarms are displayed as a tabular list. [Table 24-2](#) describes the data types and contents:

Table 24-2 Alarm Data Types

Data Type (Column)	Contents
Severity	Alarm icon that indicates the severity level attributed to the trap. The color of the alarm icon indicates the level of alarm severity, as follows:  Red = Severe  Magenta = Major  Yellow = Minor  Blue = Informational  White = Unknown
From	Network address of the device that sent the alarm to the Alarm Management System.
Summary	Summary of the event, often including the name or address of the object affected by the alarm.
Owner	Person or group responsible for handling the alarm. The default owner is SYSTEM.
Received Time	Date and time when the Alarm Management System received the alarm.
Type	Generic description of the alarm. For example, volume out of disk space.
Category	Category identified in the MIB associated with the trap-type object.

You can filter the data displayed in the alarm views based on criteria from statistics displayed in each view; see [“Filtering Alarms” on page 932](#) for details. After selecting one or more alarm entries in an alarm view, you can perform operations by right-clicking them.

Sorting Alarms

You can modify the order in which the alarms are displayed on the Active Alarm or Alarm History views by sorting the alarms. By default, the alarms are sorted in ascending order by received time.

To edit the sort settings:

- 1 Click *View > Settings > Sort*.
- 2 Select the criteria by which you want the alarms sorted. You can sort by
 - ◆ *Type*
 - ◆ *Severity*
 - ◆ *Category*
 - ◆ *Received time*
 - ◆ *Summary*
 - ◆ *Owner*
 - ◆ *Affected Object*

- 3 Indicate whether you want the alarms sorted in ascending (oldest first) or descending (the most recent alarms first) order by selecting the appropriate option in the *Sort Order* box.
- 4 Click *OK*.

Filtering Alarms

You can display the alarms in a tabular view based on filter conditions. The filter applies only to the current management session and clears when you exit ConsoleOne.

You set up a filter by selecting criteria from four drop-down lists. You can either set up simple filters that require only one line, or complex filters composed of multiple lines or groups of lines. If you set up a filter using more than one line, you must also specify the logical relationship between the line and/or group of lines.

To set up a filter:

- 1 Go to the view you want to filter.
- 2 Click *View > Settings > Filter*.
The Alarm Filter dialog box is displayed.
- 3 Select the column by which you want the Alarm Management System to filter alarms from the first drop-down list. You can filter alarms using the following columns:
 - ◆ **Severity:** Filters the alarms based on the alarm severity. Alarm severity is assigned to an alarm type.
 - ◆ **Generator Type:** Filters alarms based on the type of agent or system generating the alarms.
 - ◆ **Category:** Filters alarms based on the category of the alarm. Alarm categories are based on the MIB that defines the trap-type objects.
 - ◆ **Type:** Filters alarms based on the alarm type. The alarm type is set by the SNMP trap-type defined in the MIB or the proprietary alarm definition.
 - ◆ **Source Address:** Filters alarms based on the source addresses.
 - ◆ **Affected Object:** Filters alarms based on the affected objects.
 - ◆ **Alarm Owner:** Filters alarms based on the owner of the alarm.
 - ◆ **Alarm Summary:** Filters alarms based on the alarm summary.
 - ◆ **Rule:** Filters alarms based on the rules.
- 4 Select an operator from the second drop-down list.
The operator defines how to constrain the column you have selected to a value. For example, you can specify that the selected category must be equal to, not equal to, greater than, less than, greater than or equal to, less than or equal to, contain, or start with the value you select in the third drop-down list in order for an alarm to be displayed. Keep in mind that the list of available operators depends on the column you've selected.
- 5 Select a value from the third drop-down list.
- 6 Specify how this filter statement relates to other statements you plan to define by selecting a value from the fourth drop-down list.
 - ◆ If this is the only filter statement or if it is the last statement in a group, select *End*.

- ♦ If you want to add a line below the current filter statement, select *New Row*. A new line is added. You must define the logical relationship between the previous line and the new line. The alarms are displayed based on the logical condition you have specified. Select *And* to satisfy both the filter conditions. Select *Or* to satisfy any one of the filter conditions for the alarm to be displayed.
- ♦ If you want to add one or more lines that are unrelated to the preceding lines, select *New Group*. A new line is added. An additional drop-down list separates the new line from the preceding lines. Select a value from this drop-down list to indicate the relations between the filter statements. Select *And* if you want both the filter statements to be satisfied. Select *Or* if you want only one of the filter statements in one of the groups to be satisfied. Select *End* from the fourth drop-down list when you add a new group.

7 Click *OK* if you have defined filters.

The alarm list is updated to display only those alarms that meet the filter criteria you defined.

24.2.3 Enabling and Disabling Alarms

Novell ZENworks Server Management provides default threshold values for managed NetWare and Windows* servers and network segments hosting the Traffic Analysis Agents for a station connected to a segment. An alarm is generated if the values exceed the threshold values. The server threshold alarms are enabled by default, but the segment threshold alarms are not.

IMPORTANT: In order to modify the segment properties, you must have the Traffic Analysis Agents for NetWare or Windows hosted on a station, connected to the segment.

To enable or disable segment threshold alarms:

- 1 Right-click the segment object, then click *Properties*.
- 2 If it is not already displayed, select the *Segment Alarms* tab.
- 3 Select the alarm you want to enable or disable, then click *Edit*.
- 4 In the *Value* field, specify the threshold value after which an alarm should be generated.
- 5 In the *Sampling Interval* field, specify the time (in seconds) that the threshold value must exceed in order to generate an alarm.
- 6 Select the *Enable* check box.
- 7 Click *OK*.

24.2.4 Resolving Alarms

Alarms that occur on segments and devices on your network are added to the alarm manager database and are presented in the Active Alarms and Alarm History views. Entries in the alarm manager database remain in the database until the alarm is deleted. The database records the status of the alarm as it is first acknowledged, then assigned to a group or user, to the point where it is deleted from the database after the owner has resolved the problem.

Resolution operations for alarms are displayed when you right-click a single entry or multiple entries in an alarm view and click any of the following actions:

- ♦ [“Assigning Alarms” on page 934](#)
- ♦ [“Owning Alarms” on page 934](#)

- ◆ [“Handling Alarms” on page 935](#)
- ◆ [“Adding Notes to Alarms” on page 935](#)
- ◆ [“Jump to the Affected Node” on page 935](#)

You can also access the alarm action menu items from the *View* menu in Novell ConsoleOne.

The order in which you perform the handling, assigning, and owning of an alarm or multiple alarms depends on your organization. Keep in mind that after you handle an alarm, it is removed from the Active Alarms list and only appears in the Alarm History list. A suggested course for resolving an alarm is for you to first assign the alarm to a group or team member, then have someone from the group take ownership of the alarm. When the network problem or event has been resolved, the team member can remove it from the Active Alarms list and eventually delete it from the Alarm History. By following this process, you can track the alarm status from creation through resolution, until it is finally deleted from the Alarm History list.

Assigning Alarms

You can specify the group or user that is assigned to handle an alarm. This allows you to use any team assignments you already have within your organization. For example, you might have a group or team member assigned to handle all alarms relating to NetWare servers. You can assign one or more alarms to a group or user if you have been granted access to assign alarms through the Role-Based Services. You can use an alarm filter to help you determine groups based on certain filtering criteria. See [“Filtering Alarms” on page 932](#) for information on filtering options.

To assign an alarm:

- 1 Select the alarm you want to assign from the [Active Alarm](#) or [Alarm History](#) list.
- 2 Click *View > Assign*.
- 3 In the *Username* field, select the name of the person or group to which you want to assign the alarm.

For more information on users, see [“Adding a New User” on page 954](#)

The name you select does not correlate to users in Novell eDirectory and can represent the organizational structure you already have in place.

- 4 Click *OK*.

Owning Alarms

A user can take ownership of one or more alarms. If a user is a member of a group assigned to resolve a network problem, the team member can take ownership of the alarm and eventually delete the alarm to remove it from the alarm manager database.

To take ownership of an alarm:

- 1 Select the alarm from the [Active Alarm](#) or [Alarm History](#) view.
- 2 Click *View > Own*.

The value in the *Owner* field changes to the Novell eDirectory name you are logged in as.

You cannot customize this option; the user logged in to ConsoleOne always becomes the owner of the alarm when this action is used.

Handling Alarms

Alarms displayed in the Active Alarm view have not been handled by anyone. After the alarm is handled, it is removed from the *Active Alarm* list, and any alarm indicators shown in other views in ConsoleOne are removed.

See “[Recognizing Alarm Indicators](#)” on page 928 for information on different types of alarm indicators. After it is removed from the *Active Alarm* list, the alarm is still displayed in the [Alarm History](#) view until it is deleted by the owner.

To handle an alarm:

- 1 Select the alarm from the [Active Alarm](#) list.
- 2 Click *View > Handle*.

The alarm is removed from the Active Alarm list. You can still display information about the alarm by switching to the [Alarm History](#) view.

Adding Notes to Alarms

You can add a note to any of the alarms displayed in the Active Alarm view or Alarm History view. The note can contain any relevant useful information about the alarm.

- 1 Select the alarm from the [Active Alarm](#) or [Alarm History](#).
- 2 Click *View > Note*.
- 3 In the Note dialog box, create a note for the alarm.
- 4 Click *OK*.

The alarm icon now has a note icon associated with it, indicating that a note has been added to the alarm.

If you want to delete the note from the alarm, repeat step 2. Delete the note that you created in the Note dialog box, then click *Apply*. The note is deleted for the alarm, and the note icon is not displayed.

Jump to the Affected Node

You can jump to the affected node where the alarm has been triggered and perform the necessary action to rectify the problem.

- 1 Select the alarm from the [Active Alarm](#) or [Alarm History](#).
- 2 Click *View > Jump to Affected Node*.

The Console view is displayed and the node on which the alarm has triggered is highlighted.

24.2.5 Deleting Alarms

Alarms displayed in the Alarm History view can be deleted from the alarm list after problem resolution. You can delete one or more alarm entries to remove the alarm from the list. To delete an alarm, you must have access to view the alarm history and to delete alarms through the Role-Based Services.

There are two ways to delete alarms:

- ♦ You can delete alarms manually from the Alarm History view. See [“Deleting Alarms from ConsoleOne” on page 936](#)
- ♦ You can delete alarms automatically using the Alarm Management System purge utility. See [“Deleting Alarms Using the Purge Utility” on page 936](#).

IMPORTANT: The alarm manager database, located on the management server, records the status of every alarm instance received by the Alarm Management System. You must be diligent in deleting alarms after a problem is resolved in order to keep the database from taking up excessive disk space. Currently, the alarm manager database uses the Alarm purge utility (on by default) to automatically delete entries after a period of time or based on the size of the database.

Deleting Alarms from ConsoleOne

You can manually delete alarms through ConsoleOne.

- 1 Select the alarms you want to delete from the [Alarm History](#) list.
- 2 Click *View > Delete*.

The alarms are removed from the Alarm History view.

Deleting Alarms Using the Purge Utility

You can delete alarms automatically using the Alarm Management System purge utility. Before you can use this utility, you must set up the utility's configuration file, `ampurge.properties`, which is located in the properties directory on the server and volume where you installed the alarm manager database. Then you can schedule the utility to run automatically at a specified time of day. The following sections describe how to set up and use the Alarm Management System purge utility:

- ♦ [“Setting Up the Purge Utility Configuration File” on page 936](#)
- ♦ [“Setting Up the Purge Utility to Run Automatically” on page 937](#)

Setting Up the Purge Utility Configuration File

The Alarm Management System purge utility configuration file, `ampurge.properties`, defines the criteria for selecting the alarms to be purged as well as the time of day the process should run. This file is located in the properties directory on the server and volume where you installed the alarm manager database.

Before you can run the purge utility, you must set up the configuration file as follows:

- 1 Open the `ampurge.properties` file with a text editor.
- 2 Set the criteria for purging alarms by editing the values of the following lines in the file:
 - ♦ `SeverityInformationalPurgeWait`: The number of days before informational alarms will be purged.
 - ♦ `SeverityMinorPurgeWait`: The number of days before minor alarms will be purged.
 - ♦ `SeverityMajorPurgeWait`: The number of days before major alarms will be purged.
 - ♦ `SeverityCriticalPurgeWait`: The number of days before severe alarms will be purged.
 - ♦ `SeverityUnknownPurgeWait`: The number of days before unknown alarms will be purged.

By default, alarms of all severity levels are purged after seven days.

- 3 Save the configuration file.

Setting Up the Purge Utility to Run Automatically

You can schedule the purge utility to run daily to ensure that the alarm manager database does not consume excessive disk space. Before you can set up the utility to run automatically, you must make sure to set up the file with your preferences for deleting alarms of various severities. See [“Setting Up the Purge Utility Configuration File” on page 936](#).

To set up the utility to run automatically:

- 1 Open the `ampurge.properties` file with a text editor.
- 2 Set the time of day you want the utility to run by editing the `PurgeStartTime` entry.
Valid values are 0 to 23, where 0 is midnight and 23 is 11:00 p.m. Keep in mind that the purge utility is memory intensive and can occupy the server for several minutes. Therefore, you should set the utility to run during off-peak hours.
- 3 Save and close the file.
- 4 Open the `alarmmanager.properties` file and verify that the following line exists:
`AlarmPurgeService=yes`
If the line does not exist, add it to the end of the file.
- 5 Save and close the file.
- 6 Restart the server.

24.2.6 Performing Actions on Alarm Templates

By editing the alarm disposition associated with each alarm template, you can configure an alarm to automatically perform an action when an alarm occurs. Alarm dispositions are created for each alarm template in the Alarm Manager database and default settings are assigned to them. You can edit the alarm dispositions to enable the following actions:

- ♦ [“Sorting Alarm Templates” on page 937](#)
- ♦ [“Modifying the Severity and State of the Alarm” on page 938](#)
- ♦ [“Deleting Alarm Templates from Novell ConsoleOne” on page 938](#)
- ♦ [“Printing the Alarm Disposition” on page 939](#)
- ♦ [“Copying Alarm Templates to Microsoft Excel” on page 939](#)

Sorting Alarm Templates

The Alarm Management System system enables you to sort the alarm templates based on different conditions. This option is enabled by default. You can sort the templates based on Severity, Generator Type, Category, or Type. By default, the sorting is done based on the Type. You can also sort the templates based on a single field by selecting the field from the drop-down list under the *Sort Items By* option, or you can sort the templates based on different combinations of fields by using the *Then By* options.

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.

- 2 Click the *Alarm Disposition* tab.
- 3 In *Templates* tab, click the *Sort* button to display the Template Sorting dialog box.
- 4 Select fields from *Sort Items By* drop-down list.
- 5 Select fields from *Then By* drop-down list.
- 6 Click *OK*.

The templates are sorted based on the field selected in the *Sort Items By* and *Then By* options. For example, if you want to sort the templates based on severity, category, generator type, and Type, first select *Severity* in the *Sort Items By* list, then select *Category*, *Generator Type* and *Type* in the three *Then By* drop-down lists. The templates are sorted first based on severity, then on the category, then by the generator type, followed by the type.

Modifying the Severity and State of the Alarm

The alarm disposition includes other configuration settings that include modifying the severity or the state of the alarm. You can modify the severity or the state of the alarm, or both. The incoming alarms will display the modified severity and the state.

To change the severity and/or state of the alarm:

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* tab.
- 3 In the *Templates* page, select the alarm that you want to edit from the *Alarm Templates* list, then click *Modify* to display the Modify Template dialog box.
- 4 To modify the severity of the alarm, select the severity from the drop-down list. You can change the severity of the alarms to one of the following:

- Informational
- Minor
- Major
- Critical
- Default

- 5 To modify the state of the alarm, select the state from the drop-down list. You can change the the alarm state to one of the following:

- Operational
- Degraded
- Non-operational
- Default

- 6 Click *OK*.

Deleting Alarm Templates from Novell ConsoleOne

You can now delete the alarm templates from the Alarm Templates list through ConsoleOne. The alarms corresponding to the deleted templates are not processed by the Alarm Manager.

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.

- 2 Click the *Alarm Disposition* tab.
- 3 In *Templates* tab, select the alarm template that you want to delete from the *Alarm Templates* list, then click *Delete*.
- 4 Click *Yes* in Delete Template dialog box.

Printing the Alarm Disposition

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object then, click *Properties*.
- 2 Click the *Alarm Disposition* tab.
- 3 On the *Templates* page, select the alarm template from the *Alarm Templates* list, then click *Print*. You can also select multiple alarm templates by pressing Ctrl + clicking them.
- 4 Select the alarms in the Print Alarms dialog box, then click *Print*.

Copying Alarm Templates to Microsoft Excel

You can now copy the alarm templates to a Microsoft* Excel spreadsheet.

- 1 Select the alarm templates you want to copy.
- 2 Press Ctrl+C.
- 3 In the Microsoft Excel spreadsheet, press Ctrl+V.

24.3 Managing the Rule-Based Alarm Management System

The Rule-Based Alarm Management System allows you to configure a rule on the site server and helps you in processing, storing, and monitoring alarms. It provides you with tools and back-end services to use, and manage the rule information. The Rule-Based Alarm Management System component is also fully integrated with other Novell ZENworks Server Management components. It provides access control through the Role-Based Services component. The Rule-Based Alarm Management System provides a centralized location for processing and viewing the rules generated by devices and systems throughout your network. In addition, you can also set specific conditions and actions to be performed when an alarm occurs.

A rule consists of two parts, namely set of conditions and set of actions. When Alarm Manager receives an alarm, it matches various parameters of the Alarm with the set of conditions in a rule. If all the conditions specified in a rule are satisfied, then the set of actions specified in the rule is performed. The rules are processed in the order of precedence and the topmost rule has the highest precedence.

When more than one rule is specified, the incoming alarm is matched with the rules beginning with the topmost enabled rule in the list. If the incoming alarm matches with any rule, then only corresponding actions are carried out, and there will be no further processing of remaining rules. If the incoming alarm fails to satisfy any of the enabled rules in the list, then the Alarm is discarded.

ConsoleOne provides a mechanism to organize the alarms based on the Alarm Disposition Rules.

For more information on the Alarm Disposition Rule, see the following topics:

- ◆ [Section 24.3.1, “Understanding the Properties,” on page 940](#)

- ♦ [Section 24.3.2, “Understanding the Conditions,” on page 940](#)
- ♦ [Section 24.3.3, “Understanding the Actions,” on page 944](#)
- ♦ [Section 24.3.4, “Performing Actions on Rules,” on page 951](#)

24.3.1 Understanding the Properties

The Properties page available from the of Rule Configuration page contains the name of the rule and its corresponding description. The description that you specify here is displayed in the Rule Description on the Available Rules page.

The Properties page also displays the date and time when the rule was created and when it was last modified. This information is system-generated.

The title bar of the Rule Configuration page is appended with name of the rule you have provided in the Rule Name text box.

24.3.2 Understanding the Conditions

The Conditions page available from the Rule Configuration page consists of multiple conditions that you can define in order to process an incoming alarms. To configure a rule, you must define at least one Condition. You receive only those alarms that meet the conditions you have defined in the Conditions page.

The Conditions page includes the following conditions:

- ♦ [“Source Addresses” on page 940](#)
- ♦ [“Severity, State, and Specific Alarms” on page 941](#)
- ♦ [“Time Intervals” on page 943](#)

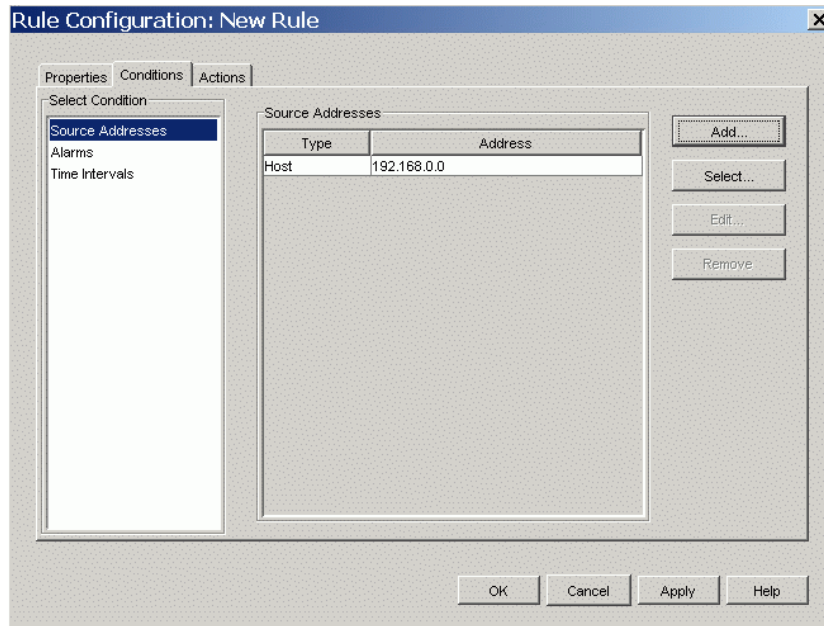

Source Addresses

Source Address conditions enable you to process on incoming alarms based on their source addresses. You can define source addresses as either the host address or a range of IP addresses. You can also select one or more nodes or containers from the Atlas, which will be configured as a source address. The Source Addresses list is updated to display the host address or range of IP addresses or nodes you have added.

If you configure a condition to process an incoming alarm based on their source addresses, you receive only those alarms that are coming from the specified addresses.

To configure a rule with Source Address as a Condition:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Conditions*.
- 4 By default, the Source Address page is selected.

- 5 Click *Add*.
- 6 In Add Source Address dialog box, specify the Host Address, DNS name, or range of IP addresses, then click *OK*.
You can select one or more nodes or containers from the Atlas by clicking on *Select*.
- 7 Click *Apply* or *OK*.

As an administrator, you can also edit or remove the existing source address details.

NOTE: If you do not specify any source address, the system accepts all alarms, irrespective of the source address it comes from.

Severity, State, and Specific Alarms

The Conditions page of Rule Configuration page includes other configurations that filters alarms based on their severity, state, and ID. You can select one or more levels of severity, including Critical, Minor, Major, Informational, and Unknown. You can also select one or more state, including Operational, Degraded and Non-Operational. For example, if you select the severity as Critical and the state as Degraded, then you get alarms only if they are of Critical severity with the state as Degraded.

To configure a rule with specific alarms as a Condition:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Conditions*, then click *Alarms*.

- 4 Select one or more severity and state.
- 5 If you want to configure alarm as part of Conditions, click *Add*.
- 6 Select the alarms you want as part of Conditions.

You can also sort the alarms. While sorting the alarms, you can select one or more alarms by pressing **Ctrl + clicking** the alarms. For more details on sorting the alarms, refer to [“Sorting Alarm Templates” on page 937](#)

- 7 Click *Apply* or *OK*.

As an administrator, you can also remove the existing alarms from the list.

NOTE: You can also configure the alarms based on varbinds. This is an optional feature and is provided as an advanced configuration criteria. For more details on advanced alarm configuration, refer to [“Advanced Alarm Configuration” on page 942](#) below.

Advanced Alarm Configuration

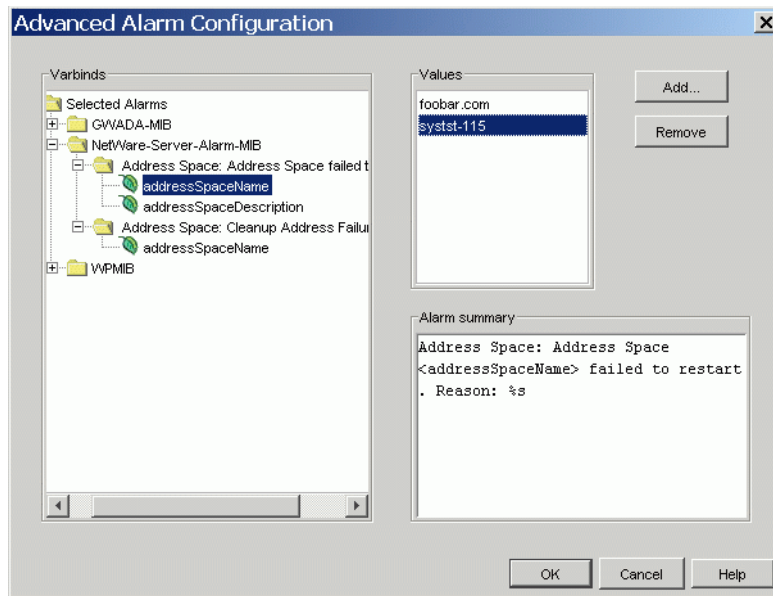

Advanced Alarm Configuration allows you to filter and select alarms based on their varbinds. Varbinds are the predefined variables of a trap. When a trap is generated, corresponding values are filled in the predefined variables and sent along with trap.

You can also add a value to the varbinds. To add a value, you must expand the tree until you see the varbinds of a selected alarm and select the required varbind.

To configure a rule with specific varbinds as a Condition:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Conditions*, then click *Alarms*.
- 4 Click *Add* and select an alarm that you want to set as part of Conditions.

- 5 Click *Advanced Alarm Configuration*.

- 6 In Advanced Alarm Configuration dialog box, expand the tree until you see the varbinds of a selected alarm.
- 7 Select a varbind to which you want to add a value.
- 8 Click *Add* and specify a value in Add Value dialog box, then click *OK*.
The Advanced Alarm Configuration page also displays summary of the alarm you have selected. The Summary contains name of the alarm and the varbinds included in it.
- 9 Click *OK* in the Advanced Alarm Configuration dialog box.
- 10 Click *Apply* or *OK*.

Varbinds values displayed in the list can also be deleted.

Time Intervals

You can also specify a time interval as a configuration criteria. If you do so, you will get an alarm only if the alarm arrives within the stipulated time interval.

To configure a rule with specific time interval as a Condition:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Conditions*, then click *Time Intervals*.

4 Move Green ruler to your desired time, which indicates starting time of an interval. Start time is set according to the ruler you have set.

You can also specify the time in *Start time* field. The ruler will set accordingly.

5 Move red ruler to your desired time, which indicates ending time of an interval. End time is set according to the ruler you have set.

You can also specify the time in *End time* field. The ruler will set accordingly.

6 Click *Add*.

7 Click *Apply* or *OK*.

As an administrator, you can also remove the existing time interval. If you do not specify any time intervals, the system accepts all alarms, irrespective of the time when they come.

IMPORTANT: The time interval is always displayed in multiples of 15. For example, if you select the Start time as 1:10, the Alarm Management System takes the time as 1:15, and if you select the Start time as 1:30, the Alarm Management System takes the time as 1:30.

24.3.3 Understanding the Actions

Actions allows you to perform various actions when an alarm occurs. You can create a rule to automatically perform an action when an alarm occurs. To configure a rule, it is mandatory to define one of the actions.

The following sections describes the different ways you can configure Actions:

- ♦ “SMTP Mail Notification” on page 945
- ♦ “Launching an External Program” on page 946
- ♦ “SNMP Traps Forwarding” on page 948

- ♦ “Alarms Forwarding” on page 948
- ♦ “Miscellaneous” on page 949

SMTP Mail Notification

SMTP Mail Notification allows you to send SMTP messages to recipients who are specified to receive e-mail notification. You can also send SMTP mail notification to the SMTP server running on a port other than the default port.

The incoming and outgoing e-mail in the SMTP Host field is handled by the IP address or the port number of the SMTP host server.

To configure a rule with SMTP mail notification as an Action:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*.
- 4 By default, the SMTP Mail Notification page is selected.
- 5 Select *Enable*.
- 6 Enter the IP address or the port number (optional) of the SMTP host server that handles incoming and outgoing e-mail in the *SMTP Host* field.
If you are specifying the port number, specify the port number after the IP address with a colon (:) preceding it. For example, if the IP address of the SMTP host server is 207.68.173.245, and the port number is 12345, specify as 207.68.173.245:12345.
You can click *Test* to verify if the SMTP server is running on the specified IP address or not.
- 7 Enter the e-mail address from where the mail notification is being sent.
- 8 Enter the e-mail addresses of the recipients in the *To* field.
You can specify more than one e-mail address by separating them with commas.
- 9 Enter the subject of the e-mail in the *Subject* field.
- 10 Enter a message for the e-mail, if any, in the *Message* field.
- 11 Click *Apply* or *OK*.

The subject and message, which you are specifying as a text strings, can contain any of the variables listed in [Table 24-3](#). These variables allow you to add details to your message about the segment or device generating the fault or event. All variables must be preceded by a percent sign (%). For example, the subject line could include the %v variable to display the severity of the alarm. You can also specify the width for the variables. %(*nnn*)X can be used to limit the length of the %X value to *nnn* characters. X represents any format specifier. For example, %(10)a is displays up to 10 characters of the Alarm ID.

Table 24-3 List of Variables

Variable Parameter	Name	Description
a	Alarm ID	Identification number of the alarm as it is stored in the database.

Variable Parameter	Name	Description
c	Affected Class	Class of equipment that sent the alarm. This can be any portion of the network and is categorized in the database for indexing.
o	Affected Object Number	Identification number of the node that generated the alarm as it is stored in the database.
s	Alarm Summary String	Message describing the alarm. (This is the same as the status bar ticker-tape message.)
t	Alarm Type String	Description of the alarm. This matches the description in the Alarm Type column in the Alarm Summary window.
v	Severity Number	Alarm severity can be 4 = critical 3 = major 2 = minor 1 = informational All others are unknown.
n	Affected Object Name	Identification name of the node affected by the alarm.
p	Source Address	The source address of the agent that generated the alarm.
-h	Remove Default Header	Truncates the default header while sending an SMTP message.

IMPORTANT: If you right-click in the body or subject area of SMTP Mail Notification, you get a context menu that contains all the variable parameters. You can select any desired variable to insert it in the message text. This variable is added at the current cursor position.

Launching an External Program

As part of editing the disposition of an alarm, you can set options to automatically launch any program on the Novell ZENworks Server Management server when an alarm is received. For example, you might want an alarm to launch a program that sends a message to the system administrator's pager.

Although ZENworks Server Management provides the capability to launch applications, the product does not provide any predefined programs. However, you can launch an NLM and run scripting routines or use third-party programs.

You can specify any necessary arguments or script variables in the Argument field. Arguments are passed directly to the program; text is not parsed, but is read as literal text strings. Variables must be preceded with a percent sign (%). The percent sign can be followed by an optional length field that limits the length to which the parameter can expand. You can also specify the width for the variables. `%(nnn)X` can be used to limit the length of the `%X` value to *nnn* characters. X represents any format specifier. For example, `%(10)a` displays up to 10 characters of the Alarm ID.

To set up automatic application launching:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.

- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Launching Application* page.
- 4 Select *Enable*.
- 5 Enter the complete path and name of the application in the *Application Name* field.
- 6 Enter any necessary execution arguments or script variables in the *Arguments* field, then click *Apply* or *OK*.

Arguments are passed directly to the program; text is not parsed, but is read as literal text strings. Variables must be preceded with a percent sign (%). The percent sign can be followed by an optional length field that limits the length to which the parameter can expand. You can also specify the width for the variables. `%(nnn)X` can be used to limit the length of the `%X` value to `nnn` characters. `X` represents any format specifier. For example, `%(10)a` will display the Alarm ID up to 10 characters.

Table 24-4 lists the variables you can use when launching a program:

Table 24-4 List of Variables you can use when launching a program

Variable	Name	Description
a	Alarm ID	Identification number of the alarm as it is stored in the database.
c	Affected class	Class of equipment that sent the alarm. This can be any portion of the network and is categorized in the database for indexing.
o	Affected object number	Identification number of the node that generated the alarm as it is stored in the database.
s	Alarm summary string	Message describing the alarm. (This is the same as the status bar ticker-tape message.)
t	Alarm type string	Description of the alarm. This matches the description in the Alarm Type column in the Alarm Summary window.
n	Affected object name	Identification name of the node affected by the alarm.
p	Source Address	The source address of the agent that generated the alarm.
v	Severity number	Alarm severity can be 1 = severe 2 = major 3 = minor 4 = informational All others are unknown.

IMPORTANT: If you right-click in the body or subject area of SMTP Mail Notification, you get a context menu that contains all the variable parameters. You can select any desired variable to insert it in the message text. This variable is added at the current cursor position.

SNMP Traps Forwarding

The Rule-Based Alarm Management System can be configured to forward an unmodified SNMP trap. The trap is automatically forwarded to the IP address of the target management station or server.

IMPORTANT: If you are specifying the port number, specify the port number after the IP address with a colon (:) preceding it. For example, if the IP address of the SNMP host server is 207.68.173.245, and the port number is 12345, specify it as 207.68.173.245:12345. By default, the port number is 162.

You can also delete one or more targets from the list.

To forward SNMP traps:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *SNMP Trap Forwarding* page.
- 4 Select *Enable*.
- 5 Enter the IP address or the port number (optional) of the server to which you want to forward traps in the *SNMP Target Address* field, then click *Add*.

If you are specifying the port number, specify the port number after the IP address with a colon (:) preceding it. For example, if the IP address of the SNMP host server is 207.68.173.245, and the port number is 12345, specify as 207.68.173.245:12345.

The server is added to the List of Targets. Repeat this step for all servers you want to receive the traps.

- 6 Click *Apply* or *OK*.

Alarms Forwarding

The Rule-Based Alarm Management System can be configured to forward a processed alarm to other ZENworks Server Management servers. Specify the IP address or server name of the target management server in the Add Target dialog box and the alarm is automatically forwarded.

To add a server to the target list, select the ZENworks Server Management site and ZENworks Server Management host to which you want to forward alarms.

To remove a server from the list, select a server you want to remove and click Remove.

To forward alarms:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Alarm Forwarding* page.
- 4 Select *Enable*.

- 5** To add a target server to receive the alarms:
 - 5a** Select the Novell ZENworks Server Management site to which you want to forward alarms in the *Site Name* field.
 - 5b** Select the Novell ZENworks Server Management host to which you want to forward alarms in the *Site Host* field.
 - 5c** Click *Add*.
The server is added to the List of Targets. Repeat this step for all servers to which you want to forward alarms.
- 6** Click *Apply* or *OK*.

Miscellaneous

The *Miscellaneous* option on the Rule Configuration page consists of items like archiving alarms and showing received alarms on the ticker bar. In addition, it allows you to configure other options such as auto handling of an alarm and audible beeps.

The options are as follows:

- ♦ “Archiving Alarm Statistics” on page 949
- ♦ “Displaying a Ticker-Tape Message” on page 950
- ♦ “Beep On Console” on page 950
- ♦ “Auto Handling of an Alarm” on page 950
- ♦ “Displaying Alarms with Specific Severity and State” on page 951
- ♦ “Assigning Alarms to the User” on page 951

Archiving Alarm Statistics

The Rule-Based Alarm Management System system provides data to the reporting tools to generate detailed reports on alarms and network events. Enabling the *Archive* option stores the alarm in the alarm manager database on the management server.

This option is enabled by default. You should disable this option only on the types of alarms that you do not want to track and analyze. You disable this option by deselecting the *Archive* option.

To enable or disable alarm archiving:

- 1** Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2** By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3** Click *Actions*, then select *Miscellaneous* page.
- 4** To disable alarm archiving, click the *Archive* check box to remove the check mark.
or
To enable alarm archiving, click the *Archive* check box to add the check mark.
- 5** Click *Apply* or *OK*.

Displaying a Ticker-Tape Message

The ticker-tape message is displayed in the ConsoleOne status bar and provides a summary of the most recent alarm or network event.

This option is enabled by default. You might want to edit your alarm dispositions so that only important alarms that you want to monitor display a ticker-tape message. You can disable this option by deselecting the *Show on Ticker Bar* option.

To disable or enable a ticker-tape message:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Miscellaneous* page.
- 4 To disable the ticker-tape message, click the *Show on Ticker Bar* check box to remove the check mark.

or

To enable the ticker-tape message, click the *Show on Ticker Bar* check box to add the check mark.

- 5 Click *Apply* or *OK*.

Beep On Console

The Miscellaneous page includes configuration settings such as making an audible beep in ConsoleOne. The sound alerts the user of an occurrence of an alarm. Useful applications of this function include when a server abends, when a server is downed by user, or when the file system is full.

This option is disabled by default. You should enable this option for important alarms that you want to monitor. You can enable this option by selecting *Beep on Console* option.

To enable or disable an audible beep:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Miscellaneous* page.
- 4 To enable the audible beep function, select the *Beep on Console* check box to add the check mark.

or

To disable the audible beep function, select the *Beep on Console* check box to remove the check mark.

- 5 Click *Apply* or *OK*.

Auto Handling of an Alarm

Auto handling store the alarms directly to History instead of storing them into active alarms.

This option is disabled by default. You should enable this option for important alarm that you want to auto handle. You enable this option by selecting the *Auto Handle* option.

To auto-handle an alarm:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Miscellaneous* page.
- 4 To enable the auto handling, click the *Auto Handle* check box to add the check mark.
or
To disable the auto handling, click the *Auto Handle* check box to remove the check mark.
- 5 Click *Apply* or *OK*.

Displaying Alarms with Specific Severity and State

Alarms with a specified severity and state, other than the Severity and State specified in the Alarm Template, are displayed in the Alarm History and Active Alarms View.

The Severity options are Critical, Major, Minor, Informational, and Unknown, and the State options are Operational, Degraded, Non-Operational, and Unknown.

To display the alarms with specific severity and state:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Miscellaneous* page.
- 4 Select the Severity and State from the drop-down list.
- 5 Click *Apply* or *OK*.

Assigning Alarms to the User

The users that you have added in the Manage Users list are displayed in the *Assign to User* drop-down list. You can select any user from the drop-down list to assign an alarm to that user.

To assign an alarm to a specific user:

- 1 Right-click the ZENworks Server Management site object in the left frame of ConsoleOne, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New* or *Edit*.
- 3 Click *Actions*, then select *Miscellaneous* page.
- 4 Select a user from the drop-down list.
- 5 Click *Apply* or *OK*.

For more details on managing users, refer [“Managing the Users” on page 954](#)

24.3.4 Performing Actions on Rules

You can perform the following activities on a rule associated with an alarm template:

- ♦ [“Creating and Configuring a Rule” on page 952](#)

- ◆ “Editing a Rule” on page 953
- ◆ “Copying a Rule” on page 953
- ◆ “Deleting a Rule” on page 953
- ◆ “Printing a Rule” on page 953
- ◆ “Exporting a Rule to a File” on page 954
- ◆ “Managing the Users” on page 954
- ◆ “Changing the Precedence of Rule” on page 955
- ◆ “Enabling and Disabling a Rule” on page 955

Creating and Configuring a Rule

You can create a rule to automatically perform an action when an alarm occurs.

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 By default, Alarm Disposition page is selected. Click *Rule*, and then click *New*.
- 3 In Rule Configuration dialog box, specify the name of the rule. The name you specify is added to the title bar of the Rule Configuration page.
- 4 (Optional) Specify a description for the rule you are creating.
- 5 Click *Conditions*. By default, the *Source Address* is selected.
 - 5a Specify the source addresses from where you want users to get an alarms. For more details on Source Addresses, refer to “[Source Addresses](#)” on page 940
- 6 Click *Alarms*, then select *Severity*, *State* and *Alarms* as per your requirements. For more details on Alarms, refer to “[Severity, State, and Specific Alarms](#)” on page 941
- 7 Click *Time Intervals*, then select specific time durations. For more details on Time Intervals, refer to “[Time Intervals](#)” on page 943

IMPORTANT: To configure a rule, you must define at least one of the Condition.

- 8 Click *Actions*.
- 9 Click the *Enable* option. Specify *SMTP Server*, *From*, *To*, *Subject*, and *Message*. For more details on SMTP Mail Notification, refer to “[SMTP Mail Notification](#)” on page 945
- 10 Click *Launching Application* and select *Enable*. For more details on Launching Application, refer to “[Launching an External Program](#)” on page 946
- 11 Click *SNMP Trap Forwarding* and select *Enable*. For more details on SNMP Trap Forwarding, refer to “[SNMP Traps Forwarding](#)” on page 948
- 12 Click *Alarm Forwarding* and select *Enable*. For more details on Alarm Forwarding, refer to “[Alarms Forwarding](#)” on page 948
- 13 Click *Miscellaneous*, then select the options as per your requirements. For more details on the Miscellaneous options, refer to “[Miscellaneous](#)” on page 949

IMPORTANT: To configure a rule, you must define at least one of the Action.

- 14 Click *Apply*, then click *OK*.

The newly created rule is appended to the *Available Rules* list and the description that you specified in Properties page is displayed under Rule Description on the Available Rule page.

Editing a Rule

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* page.
- 3 On the Rules page, select the rule you want to edit from the *Available Rules* list, then click *Edit*.
- 4 In the Rule Configuration dialog box for that rule, modify the details as per your requirements.
- 5 Click *OK*.

Copying a Rule

You can create a copy of the any existing rule listed in the *Available Rule* list. While creating a copy of a rule, you can also modify the details of a rule.

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* page.
- 3 On the Rules page, select the rule you want to copy from the *Available Rules* list, then click *Copy*.
- 4 (Optional) In the Rule Configuration dialog box for that rule, modify the details of a rule.
- 5 Click *OK*.

Deleting a Rule

Rules displayed in the *Available Rules* list can be deleted from the list. You can delete one or more rule entries to remove it from the list.

- 1 In ConsoleOne, right-click the ZENworks Server Management site object, then click *Properties*.
- 2 Click the Alarm Disposition page.
- 3 On the Rules page, select the rule you want to delete from the *Available Rules* list, then click *Delete*.
You can select more than one rule by pressing Ctrl + clicking the rules you want to select.
- 4 Click *Yes* in Confirm Deletion dialog box.

Printing a Rule

You can also print any of the rule listed in Available Rules list.

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Click the Alarm Disposition page.
- 3 On the Rules page, select the rule you want to print from the *Available Rules* list, then click *Print*.
You can print more than one rule by pressing Ctrl + clicking the rules you want to select.
- 4 In Print Rule Summaries, click *Print*.

Exporting a Rule to a File

You can export the rule information into the following file formats:

- ♦ Comma-delimited (.csv)
- ♦ HTML (.html)
- ♦ Tab-delimited (*.txt)
- ♦ Blank-space-delimited (*.txt)

- 1 In ConsoleOne, right-click the ZENworks Server Management site object then, click *Properties*.
- 2 Click the *Alarm Disposition* page.
- 3 On the Rules page, select the rule that you want to print from the *Available Rules* list, click *Print*, then click *Export*.
- 4 In the Export dialog box, select the file type you want to use to export the rule information
- 5 Specify the filename or click *Browse* to select a filename.
- 6 Click *OK*.

Managing the Users

The Manage Users page allows you to maintain a list of users and their e-mail addresses. You can use this list to select the user to whom the alarm is to be assigned. You can perform the following activities in the Manage Users page:

- ♦ [“Adding a New User” on page 954](#)
- ♦ [“Editing an Existing User” on page 954](#)
- ♦ [“Deleting an Existing User” on page 955](#)

Adding a New User

The Manage Users page allows you create a new user to whom you can assign an alarm. Added users are listed in the *Users* list on Manage Users page.

- 1 In ConsoleOne, right-click the ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* page.
- 3 On the Rules page, click *Users*.
- 4 In the Manage Users dialog box, click *New*.
- 5 In Add User dialog box, specify a username and an e-mail address.
- 6 Click *OK*.

Editing an Existing User

You can edit an existing user details, which are listed in Users list. The updated user detail is displayed in the list immediately after you update the data.

- 1 In ConsoleOne, right-click the ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* page.

- 3 On the Rules page, click *Users*.
- 4 In the Manage Users dialog box, select the user you want to edit, then click *Edit*.
- 5 In the Add User dialog box, modify the username and an e-mail address.
- 6 Click *OK*.

Deleting an Existing User

Users displayed in the Users list can also be deleted from the list.

- 1 In ConsoleOne, right-click the ZENworks Server Management site object, then click *Properties*.
- 2 Click the *Alarm Disposition* page.
- 3 On the Rules page, click *Users*.
- 4 In the Manage Users dialog box, select user you want to delete.
You can select more than one user by pressing Ctrl + clicking the users you want to delete.
- 5 Click *Delete*.

Changing the Precedence of Rule

As an administrator, you can also change the precedence of the rules that are listed in the *Available Rules* list.

The rule with the highest precedence is listed at the top of the list. You can move a rule up or down in the list by clicking the up-arrow or the down-arrow.

The default rule has the lowest precedence among all the rules and you cannot modify its order in the list.

Enabling and Disabling a Rule

As an administrator, you can also enable or disable a rule that is listed in *Available Rules* list.

To enable a rule:

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object then, click *Properties*.
- 2 Click the *Alarm Disposition* page, and then click *Rules*.
- 3 In *Enabled* column, select the option pertaining to a rule you want to enable.
- 4 Click *Apply*, and then click *OK*.

To disable a rule:

- 1 In ConsoleOne, right-click the Novell ZENworks Server Management site object then, click *Properties*.
- 2 Click the *Alarm Disposition* page, and then click *Rules*.
- 3 In *Enabled* column, deselect the option of a rule you want to disable.
- 4 Click *Apply*, then click *OK*.

IMPORTANT: Even though you cannot delete or edit the default rule, you can disable it.

24.4 Maintaining the Alarm Management System

The alarm manager database on the ZENworks Server Management server increases in size each time the Alarm Management System logs an alarm.

IMPORTANT: If you do not control the size of this database, it can increase until it fills the hard disk on the management server.

To control the size of the alarm manager database, regularly delete alarms that have been resolved or alarms that are not required for future reference or action. This deletes the instance of the alarm record from the alarm manager database and thus controls the size of the database.

You can delete alarms from the Alarm History view in Novell ConsoleOne under the View menu. For more information, see [“Deleting Alarms” on page 935](#).

24.5 Troubleshooting the Alarm Management System

When the Alarm Management System receives an unsolicited SNMP trap from an agent, it locates the appropriate alarm template for the trap-type object that is defined in the MIB of the device. If the alarm template is not available, the Alarm Management System checks the IgnoreUnknownTrap flag in the `installation_volume\installation_directory\novell zenworks\mms\mwserver\properties\alarmmanager.properties` file. If the flag value is set to True, the alarm is ignored. If the flag value is set to False, the alarm is archived in the database as an unknown trap. If the flag value is set to Yes, the alarm is ignored. If the flag value is set to No, the alarm is archived in the database as an unknown trap. The default value of the flag is set to Yes.

For the alarm to be recognized, you need to add the MIB of the device to the MIB Pool on the management server. The MIB contains the trap definitions for traps sent from the device. If the trap-type object is undefined by the Alarm Management System, it cannot resolve the type of alarm received from the trap object identifier (OID), and the alarm is unknown. See [Chapter 26, “Using the MIB Tools,” on page 999](#) for information on compiling MIBs and adding MIBs to the MIB Pool.

If you add a new device to your network, you must add the MIB to the MIB Pool. If the SNMP agent is a proxy agent hosted on a station and the software is updated, you need to update the MIB in the MIB Pool.

Understanding Server Management

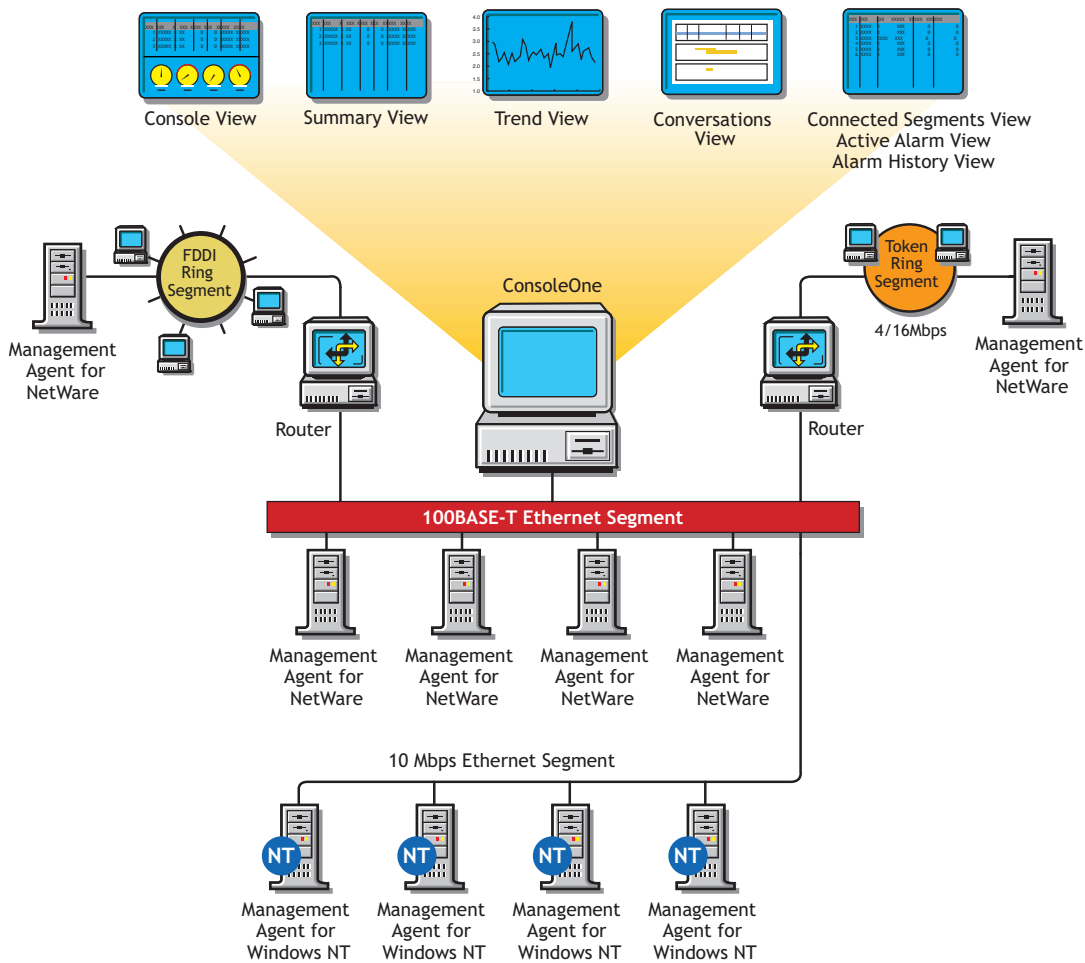

The Novell® ZENworks® Server Management components allow you to monitor, configure, and control the managed servers and nodes on your network. The SNMP-based server Management Agents for Novell NetWare® and Windows* servers provide real-time server performance data and information about server alarms and events to the network management console. By selecting a server or node from atlas page maps or hierarchical lists in the left pane of Novell ConsoleOne, you can access three main views of information:

- ◆ **Console View:** Provides details about the selected server or node. You can drill down into the server configuration to display information about the internal components of the machine, such as the devices, operating system, and services available on the machine.
- ◆ **Summary View:** Provides details about the server performance, such as alarms generated by the server, CPU utilization, and available disk space. By drilling down into the server configuration, you can also view summary information about other components, such as processors, threads, memory, and volumes.
- ◆ **Trend View:** Displays graphical representations of trend parameters, allowing you to monitor the state of a server over various periods of time. Using trend data, you can track the health status of servers, allowing you to predict potential problems and plan for future expansion of server configurations.

In addition to viewing information about the servers on your network, the server management components also enable you to configure your managed NetWare servers and execute frequently used commands from Novell ConsoleOne.

Figure 25-1 displays a functional view of the ZENworks Server Management components. It illustrates the Management Agent for NetWare and Management Agent for Windows distributed throughout a network.

Figure 25-1 Server views available from ConsoleOne

This section contains the following topics to help you understand the server management components:

- ◆ [Section 25.1, “Understanding Server Management,”](#) on page 958
- ◆ [Section 25.2, “Planning for Server Management,”](#) on page 960
- ◆ [Section 25.3, “Optimizing Server Management,”](#) on page 962
- ◆ [Section 25.4, “Managing Servers,”](#) on page 970
- ◆ [Section 25.5, “Object Hierarchy and View Details,”](#) on page 978

25.1 Understanding Server Management

The Management Agent for NetWare and the Management Agent for Windows include features that offer benefits over server management functionality included with NetWare and Windows server software.

This section includes the following topics:

- ◆ [Section 25.1.1, “SNMP-Based Server Management,”](#) on page 959
- ◆ [Section 25.1.2, “SNMP Agent Functions,”](#) on page 960

25.1.1 SNMP-Based Server Management

The main advantage of the Management Agent for NetWare and Management Agent for Windows is that they support the industry standard Simple Network Management Protocol (SNMP). SNMP is the protocol governing network management and the monitoring of network devices and their functions.

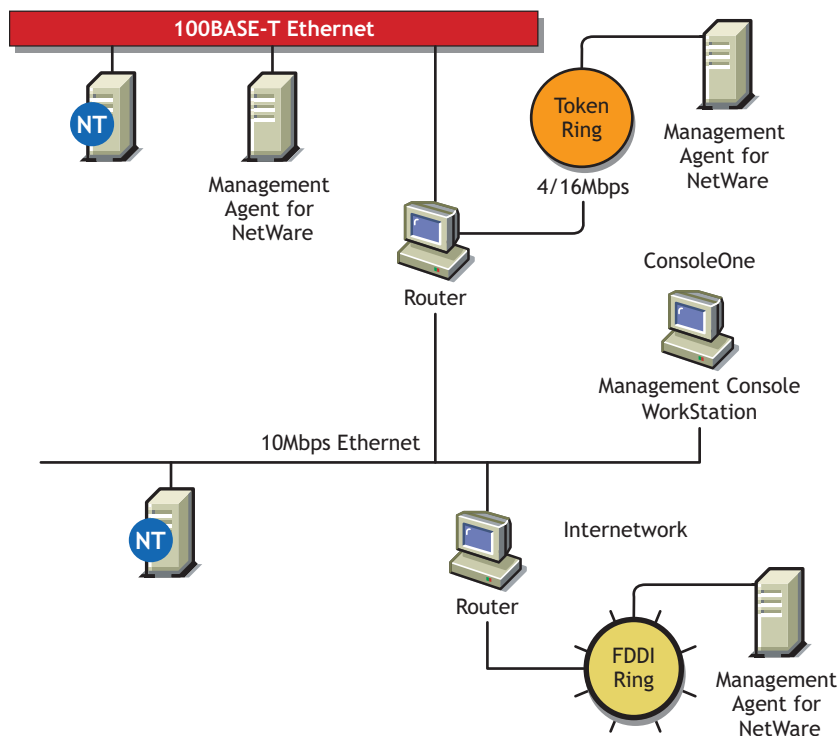

The Novell ZENworks Server Management SNMP agents support UDP/IP, IPX™, and NCP™ implementations for accepting and sending packets (datagrams). This standard mechanism allows any SNMP console or manager to request information from the Novell ZENworks Server Management SNMP agents. An SNMP console can be any console that supports SNMP; the Novell ZENworks Server Management Novell ConsoleOne fully supports SNMP v.1 communication.

SNMP Agents

The Novell ZENworks Server Management SNMP agents run on NetWare and Windows servers in your network. The agents monitor servers, collecting historical data and dynamic data in response to requests from Novell ConsoleOne. An administrator at the Novell ZENworks Server Management Novell ConsoleOne can request data simply by clicking a representative icon for any device, operating system, or service discovered on a server.

Figure 25-2 illustrates an internetwork using the Management Agent for NetWare and Management Agent for Windows and the Novell ZENworks Server Management Novell ConsoleOne.

Figure 25-2 The NetWare/Windows Agent in an Ethernet/FDDI network/token ring

25.1.2 SNMP Agent Functions

The functionality of the Management Agent for NetWare and Management Agent for Windows (the Novell SNMP-based agents for NetWare and Windows servers) can be divided into the following areas:

- ♦ Collecting Statistics
 - ♦ Monitoring: Server monitoring provides instant information about various monitored elements of the server, such as CPU utilization, memory size, cache buffers, connected users, volumes, disks, disk space usage per user, network adapters, print queues, print jobs, and loaded NetWare Loadable Module™ (NLM™) files on NetWare or Windows servers.
 - ♦ Trending: Trends provide historical data about various server objects and can be displayed in a diagram on the SNMP console. Trends are stored at the server side, which eliminates the need for continuous polling from an SNMP manager, and this data can be accessed via SNMP by any Novell ZENworks Server Management Novell ConsoleOne or other SNMP-based console.
- ♦ Alarm Notification: More than 580 different types of alarms or events (SNMP traps) can be sent from any NetWare server to the Novell ZENworks Server Management system or to any other SNMP-based console.

Any Windows system, security, or application event is converted to an SNMP trap and sent to the Novell ZENworks Server Management system or to any other SNMP-based console.

The alarms inform the administrator about events that have occurred or thresholds which have been crossed.

- ♦ Configuration Management: The Management Agent for NetWare enables network administrators to remotely configure NetWare servers. There are 187 SET parameters on the NetWare server that can be used to tune the server's performance. Administrators can view settings and change all parameters from any Novell ZENworks Server Management Novell ConsoleOne.

The SNMP agents must be installed on any server that you want to manage. For information on installing the SNMP agents, or if you have already installed the agent software to servers that you want to manage, see “[Management and Monitoring Services Installation](#)” in the *Novell ZENworks 7 Server Management Installation Guide*.

25.2 Planning for Server Management

A baseline defines the typical activity of your network servers. Keeping a baseline document of activity on a server lets you determine when the activity is atypical. To create a baseline activity, you should gather statistical information when the server is functioning typically.

This section contains the following information to help you plan your server management strategy:

- ♦ [Section 25.2.1, “Creating a Baseline of Typical Server Activity,” on page 961](#)
- ♦ [Section 25.2.2, “Using the Baseline Document,” on page 961](#)
- ♦ [Section 25.2.3, “Server Baseline Document Tips,” on page 961](#)

25.2.1 Creating a Baseline of Typical Server Activity

For server statistics such as CPU utilization, you should create a trend graph that plots information over a period of time. Statistics sampling that gathers data over a short period of time can be misleading. If you modify the server's configuration, it is useful to create another baseline against which you can compare future activity.

There are two ways to create baseline documents. The first is to create them manually by printing the various trend graphs for which you want to maintain baselines. The other way is to use the server management health reports as your baseline documents. For more information on creating and generating health reports, see [“Managing the Server Management Health Reports” on page 1157](#). In either case, the data gathered can be exported into programs, such as spreadsheets, for further analysis and to maintain records over time.

25.2.2 Using the Baseline Document

The following sections will help you plan and use the baseline document:

- ♦ [“Using Baseline Documents to Set Alarm Thresholds Appropriately” on page 961](#)
- ♦ [“Using Baseline Documents to Track Server Utilization” on page 961](#)
- ♦ [“Use Baseline Documents in Troubleshooting” on page 961](#)

Using Baseline Documents to Set Alarm Thresholds Appropriately

You should set alarm thresholds for statistics on servers monitored by the SNMP agent software, so that if the threshold is exceeded, you are notified at Novell ConsoleOne. Setting alarm threshold values for statistics on a server eliminates the need for you to constantly monitor polled server statistics for problems.

Server Management components provide default values for thresholds set on server statistics; rising and falling statistics generate an alarm when a threshold is surpassed.

Using Baseline Documents to Track Server Utilization

By comparing current server performance statistics against the performance recorded in your baseline document, you can determine how performance is affected by server configuration changes. This comparison also helps you plan for growth and justify upgrades and expansion. You can view graphs of real-time trends and historical trends over hourly, daily, weekly, monthly, and yearly periods.

Use Baseline Documents in Troubleshooting

By knowing what the typical server activity is, you can recognize atypical activity, which might help you isolate the cause of a problem.

25.2.3 Server Baseline Document Tips

You should include the following key characteristics in each server baseline document:

- ♦ [“CPU Utilization” on page 962](#)
- ♦ [“Cache Buffers” on page 962](#)

- ♦ [“File Reads and Writes” on page 962](#)
- ♦ [“Volume Utilization” on page 962](#)
- ♦ [“Running Software” on page 962](#)

CPU Utilization

The CPU Utilization statistic indicates how busy the microprocessor is. High CPU utilization can cause slow network response time. Utilization is likely to be higher at some times during the day (for example, when users log in to the network in the morning, or access e-mail), week, or month. Tracking CPU utilization helps you track the load on the server processor at peak and low times. This information helps you determine the effect of current system and application processor demands and analyze the impact on performance.

Cache Buffers

Virtually all processes are handled through server cache, a block of server memory (RAM) in which files are temporarily stored. Cache buffers greatly increase server performance and enable workstations to access data quicker because reading from and writing to memory is much faster than reading from or writing to disk. The optimum cache buffer is 65% to 75% of total server memory (more does not hinder performance). Low cache buffers can cause slow server performance and abend. Service degrades noticeably at 45% of total server memory.

File Reads and Writes

By tracking data about file reads and writes in your baseline, you might be able to determine whether a bottleneck is caused by the disk I/O channel. For example, if an increasing number of “server busy” packets are sent to users and there is also an increase in the file read and write number, the cause of the bottleneck might be a slow disk I/O channel or bad disk adapter driver.

Volume Utilization

Tracking volume utilization is primarily for capacity planning. By tracking the volume space used over time, you can accurately predict when you must purchase additional storage. Tracking volume utilization can also help you prevent the server from running out of disk space.

Running Software

By including information about running software in your baseline, it is easier to spot a problem application when comparing software on different servers. It is useful to also include the memory each application uses. Then, if the server is running short of memory, you can quickly see which applications are using the most memory.

25.3 Optimizing Server Management

Examine each of the configuration options in the sections that follow to determine whether you require any of the functionality provided:

- ♦ [Section 25.3.1, “Setting Default Trends and Thresholds,” on page 963](#)
- ♦ [Section 25.3.2, “Controlling Alarm Generation,” on page 967](#)
- ♦ [Section 25.3.3, “Defining Recipients for SNMP Alarms,” on page 969](#)

25.3.1 Setting Default Trends and Thresholds

You can modify the default trends and threshold values from within Novell ConsoleOne or manually modify files on servers that have the Management Agent for NetWare or Management Agent for Windows software installed.

When server agents are first loaded, the initial (default) values for trends and thresholds are read from the `ntrend.ini` file (NetWare) or the `n_nttren.ini` file (Windows). The initial values are also used whenever a new trend file is created. A new trend file is created when an instance of a monitored object (volume, disk, interface, and so on) is discovered on the server.

Figure 25-3 is a sample excerpt from an `ntrend.ini` file:

Figure 25-3 A sample `ntrend.ini` file

```
#-----#
# #Parameter | Sample Interval | Trend Buckets | Enbl | Threshold Rising | Falling | Enbl | Type |
#-----#
```

#Parameter	Sample Interval	Trend Buckets	Enbl	Threshold Rising	Falling	Enbl	Type
NUMBER_LOGGED_IN_USERS	5	60	1	100	90	1	rising
NUMBER_LOGGED_IN_USERS	7	8928	1	90	81	1	rising
NUMBER_CONNECTIONS	5	60	1	0	0	0	rising
NUMBER_CONNECTIONS	7	8928	1	0	0	0	rising
FILE_READS	5	60	1	0	0	0	rising
FILE_READS	7	8928	1	0	0	0	rising
FILE_WRITES	5	60	1	0	0	0	rising
FILE_WRITES	7	8928	1	0	0	0	rising
FILE_READ_KBYTES	5	60	1	0	0	0	rising
FILE_READ_KBYTES	7	8928	1	0	0	0	rising
FILE_WRITE_KBYTES	5	60	1	0	0	0	rising
FILE_WRITE_KBYTES	7	8928	1	0	0	0	rising
LSL_IN_PACKETS	5	60	1	0	0	0	rising
LSL_IN_PACKETS	7	8928	1	0	0	0	rising
LSL_OUT_PACKETS	5	60	1	0	0	0	rising
LSL_OUT_PACKETS	7	8928	1	0	0	0	rising
NCP_REQUESTS	5	60	1	0	0	0	rising
NCP_REQUESTS	7	8928	1	0	0	0	rising
CPU_UTILIZATION	5	60	1	90	81	1	rising
CPU_UTILIZATION	7	8928	1	80	72	1	rising
CACHE_BUFFERS	5	60	1	45	40	1	falling
CACHE_BUFFERS	7	8928	1	0	0	1	falling
CODE_DATA_MEMORY	5	60	1	0	0	0	rising
CODE_DATA_MEMORY	7	8928	1	0	0	0	rising

After the Management Agent for NetWare and Management Agent for Windows software is running, trend and threshold values can be changed (using Novell ConsoleOne) by making use of the threshold-setting features of Novell ZENworks Server Management. If the server is brought down, it retains the last trend and threshold settings that were set. Initial values are reset when any of the following situations occurs:

- ◆ Trend files have been deleted manually.
- ◆ If the server configuration is modified, for example, by adding a new volume, disk, or interface.

IMPORTANT: Trends are not maintained for CD volumes. Therefore, changing trend parameters for CD volumes has no effect.

The following sections contain information to help you modify initial trend and threshold values:

- ◆ [“Changing the Initial Trend Values” on page 964](#)
- ◆ [“Changing the Initial Threshold Values” on page 966](#)

Changing the Initial Trend Values

The trend values in the `ntrend.ini` file (NetWare) and `n_nttren.ini` file (Windows) specify the time interval (Sample Interval) at which a particular trend parameter is sampled, the duration of time for which those samples are kept (Trend Buckets), and whether this sampling parameter is enabled (Enbl). For each value specified by a line in the `ntrend.ini` file or `n_nttren.ini` file, a trend record is stored in a separate file in the `sys:\ntrend` directory on a NetWare server and the `\trenfile` directory on a Windows server.

Figure 25-4 depicts a line in the `ntrend.ini` file for the `NUMBER_LOGGED_IN_USERS` trend parameter with a Sample Interval of 5, Trend Buckets specified at 60, and the enable parameter specified at 1 (enabled).

Figure 25-4 A sample line from an `ntrend.ini` file

```
#-----#
# Parameter | Sample | Trend | Threshold |
#           | Interval | Buckets | Enbl | Rising | Falling | Enbl | Type |
#-----#-----#-----#-----#-----#-----#-----#
NUMBER_LOGGED_IN_USERS 5      60      1      100     90      1      rising
```

The following sections describe how to set or alter each of the parameters required for a trend file:

- ◆ [“Setting the Sample Interval” on page 964](#)
- ◆ [“Setting the Trend Buckets” on page 965](#)
- ◆ [“Enabling or Disabling a Trend File” on page 966](#)
- ◆ [“Backing Up Trend Data” on page 966](#)

You can specify more than one sampling interval or duration for any trend parameter by creating another line in the `ntrend.ini` file or `n_nttren.ini` file.

Setting the Sample Interval

The trending software enables you to collect samples of a specified parameter at any of 12 possible time intervals (Sample Interval), from 5 seconds to 1 day.

Each of these sample intervals is specified by a code number in the `ntrend.ini` file and the `n_nttren.ini` file. Table 25-1 specifies the codes used in the `ntrend.ini` and `n_nttren.ini` files for the permitted sample intervals. For example, if you want to sample a particular trend parameter once every hour, you would use the code 9.

Table 25-1 Codes to be used in the `ntrend.ini` and `n_nttren.ini` files for the permitted sample intervals

Sample Interval	Code
5 seconds	1
10 seconds	2
15 seconds	3
30 seconds	4
1 minute	5
5 minutes	6

Sample Interval	Code
15 minutes	7
30 minutes	8
1 hour	9
4 hours	10
8 hours	11
1 day	12

Setting the Trend Buckets

After you have determined a sample interval for collecting samples, you must set a duration of time for which you want to collect samples. For example, if you selected a sample interval of one hour for a particular parameter, you might decide that you want to be able to review the state of that parameter for every hour over the duration of a day.

You determine the duration of time for which a parameter is collected by the number of trend buckets you specify. You must specify a trend bucket for each sample that is collected over a specific period of time. For example, to review the state every hour for 1 day, 24 trend buckets (1 per hour x 24 hours in a day) are required.

The number of trend buckets required for any particular time duration and sample interval is calculated easily. However, for your convenience, [Table 25-2](#) shows the number of trend buckets required for each sample interval allowed, for each of seven possible time durations of from 1 hour to 1 year:

Table 25-2 Number of trend buckets required for each sample interval allowed

Sample Interval	1 Hour Duration	1 Day Duration	1 Week Duration	1 Month Duration	3 Months Duration
5 seconds	720	17280	120960	535680	1607040
10 seconds	360	8640	60480	267840	803520
15 seconds	240	5760	40320	178560	535680
30 seconds	120	2880	20160	89280	267840
1 minute	60	1440	10080	44640	133920
5 minutes	12	288	2016	8929	26784
15 minutes	4	96	672	2975	8928
30 minutes	2	48	336	1488	4464
1 hour	1	24	168	744	2232
4 hours		6	42	186	558
8 hours		3	21	93	279
1 Day		1	7	31	93

After you set the sample interval and the time duration for trend collection, you can compute the size of trend files. The number of trend buckets possible, and the approximate size in kilobytes (in parentheses), for a given sample interval and time duration are also given in [Table 25-2](#). The size of each trend bucket is 4 bytes plus 512 bytes for the header file. For example, if the sampling interval is 5 seconds for a period of 1 hour, the file size would be 720 trend buckets x 4 bytes long (rounded to the closest 4 KB boundary) plus 512 bytes for a total of 4.5 KB. There are always as many trend files as there are enabled trends.

After a particular time duration is exceeded for a file (all the trend buckets have been filled), the oldest samples are overwritten by the most recent samples. This means that the file contains the most recent duration recorded. For example, if you select a sample interval of 1 hour for a duration of 24 hours (using 24 trend buckets), the associated file contains the trend data for the last 24 hours.

Enabling or Disabling a Trend File

Each line in the `ntrend.ini` file and the `n_nttren.ini` file contains a parameter that either enables or disables the trending value to begin creating a trend file at startup. To enable the collection of data for a trend file, set this parameter to 1. To disable the collection of data for a trend file at startup, set this parameter to 0.

Backing Up Trend Data

Trend data is not automatically backed up. If you want to back up this data, you must do so manually.

Changing the Initial Threshold Values

The default threshold values in the `ntrend.ini` file and the `n_nttren.ini` file specify when a trap is generated. User-defined values are stored in the trend file header. If the parameter rises above or falls below the set threshold value, a rising or falling trap type is sent.

The following sections describe how to set or alter each of the parameters required for a threshold value:

- ♦ [“Setting Rising and Falling Thresholds” on page 966](#)
- ♦ [“Enabling or Disabling a Threshold Trap” on page 967](#)

Setting Rising and Falling Thresholds

Each line in the `ntrend.ini` file and the `n_nttren.ini` file contains a parameter for the rising threshold and the falling threshold. For each sample interval, a rising or falling trap can be generated as specified. After a trap is generated, another such trap is not generated until the sampled value falls below this threshold and reaches the falling threshold.

Figure 25-5 A rising threshold and falling threshold for a trap

In [Figure 25-5](#), Trap 1 is generated because it is the first time that the parameter value rises above the Rising Threshold. The next two times the parameter value rises above the Rising Threshold, a trap is not generated because the parameter did not fall below the Falling Threshold. Trap 2 and Trap 3 are generated because the parameter value dropped below the Falling Threshold before exceeding the Rising Threshold.

Enabling or Disabling a Threshold Trap

Each line in the `ntrend.ini` file and `n_nttren.ini` file contains a parameter that enables or disables the `ntrend.nlm` software to send traps as determined by the rising and falling thresholds. This parameter is set to 1 to enable the software to send a trap for the values given, or to 0 to disable the software from sending a trap for this parameter.

25.3.2 Controlling Alarm Generation

Each managed server has files that specify which system events result in a trap. On NetWare, the `nwtrap.cfg` and `ndstrap.cfg` files are stored in the `sys:\etc` directory. On Windows, this file is `nttrap.ini`, which is stored in the `mw\ini` directory.

On NetWare, the trap configuration file is read only when `nwtrap.nlm` is loaded; therefore, any changes made to the file do not take effect until the next time you load `nwtrap.nlm` or `ndstrap.nlm`.

The `.cfg` files on NetWare contain the list of supported traps. You can modify the `.cfg` files or `nttrap.ini` file with the following:

- ◆ Types of alarms forwarded to Novell ConsoleOne
- ◆ Community strings used for sending SNMP traps
- ◆ List of traps to be disabled, using the mask keyword
- ◆ Specific alarms that you want to prevent from forwarding

The configuration file consists of keywords and their associated data (case is ignored). Each keyword must be on a line by itself (except for mask values, where they might span several lines), and must be followed by one or more lines of associated data.

You can place comments anywhere in the file, even between a keyword and its associated information. A comment starts with a number sign (`#`), and continues to the end of the line.

[Figure 25-6](#) is an example of an `nwtrap.cfg` file:

Figure 25-6 Sample contents of the `nwtrap.cfg` file

```
#
#####
#NWTRAP.CFG
#
#NWTRAP Configuration File
#
#This file specifies information to be used by NWTRAP.NLM
#The file is read and the parameters set when NWTRAP is loaded. It must
#reside on volume SYS: in the directory SYS:\ETC and must be named
#NWTRAP.CFG to be found by NWTRAP. To change the parameters, first
#edit this file, then unload NWTRAP and load it again. Any changes to this
#file will not take effect until NWTRAP is next loaded. The parameters
#are specified by using a parameter keyword followed by the desired
#parameter value.
#
#####

Community
  Public
Time Interval
  10
Severity

mask
#      "Memory: Short term alloc failed"
#      1

#      "FileSys: Directory write error (no vol)"
#      2

#      "FileSys: File write err, by server (no path)"
#      3

#      "FileSys: File write err, by user (no path)"
#      4
```

The following sections contain information to help you control alarm generation:

- ♦ [“Setting the Time Interval \(Management Agent for NetWare Only\)” on page 968](#)
- ♦ [“Configuring Alarm Severity Levels” on page 968](#)

Setting the Time Interval (Management Agent for NetWare Only)

Sometimes an alarm repeats rapidly (several times per second or per minute) with identical or nearly identical parameters. When this occurs, the second and later alarms within a time interval are usually not as interesting as the first alarm.

To prevent the network and Novell ConsoleOne from being inundated with identical alarms, you can specify a time interval to be applied to every alarm generated. During this interval, alarms that are identical to an initial alarm are discarded.

You can define the time interval in the configuration file as follows:

```
Time Interval
n
```

where n can take any value from 0 to 232 to indicate the number of seconds that must elapse before a later alarm is not discarded.

The default time interval is 10 seconds.

Configuring Alarm Severity Levels

Use the severity keyword to set a minimum alarm severity level so that traps for lesser severity alarms are not sent.

The severity levels you can set in the `nwtrap.cfg` and `nttrap.ini` files are informational, warning, recoverable, critical, and fatal. [Table 25-3](#) lists the NetWare severity level and corresponding SNMP and Novell ZENworks Server Management severity levels:

Table 25-3 *NetWare severity level and corresponding SNMP and Novell ZENworks Server Management severity levels*

NetWare Severity Level	SNMP Severity Level	ZENworks Server Management Severity Level
0 - Informational	Informational	Informational
1 - Warning	Minor	Minor
2 - Recoverable	Major	Major
3 - Critical	Critical	Severe
4 - Fatal	Fatal	Severe
5 - Operation Aborted	Fatal	Severe
Unrecoverable	Fatal	Severe

The default keyword is warning. Under the default, all alarms with a severity level of warning or greater are forwarded.

25.3.3 Defining Recipients for SNMP Alarms

You can configure the Management Agent for NetWare to send SNMP traps (alarms) to the Novell ZENworks Server Management server or to other management nodes.

NOTE: For setting trap destinations on Windows servers, see the documentation on the SNMP Service provided with the Microsoft Windows operating system software.

Steps for designating trap target destinations are described in the following section.

Editing the `traptarg.cfg` File Manually (Management Agent for NetWare Only)

You can configure trap recipients by manually adding them to the `traptarg.cfg` file. This is useful for sending traps to third-party management consoles other than the Novell ZENworks Server Management server.

You must add trap recipients manually by specifying their addresses in the `traptarg.cfg` file, which is located in the `sys:\etc` directory of all NetWare servers.

The `traptarg.cfg` defines the recipients of SNMP traps. You can use this file to define recipients of SNMP traps over IPX and UDP/IP. The file is fully annotated to show you how to divide the file into IPX and UDP/IP sections and how to write the IPX and IP addresses of recipients.

The `traptarg.cfg` file is read only when SNMP is loaded. In most cases, this means bringing the server down and restarting it because a variety of modules must be unloaded and reloaded as well. Thus, any changes made to the `traptarg.cfg` file do not take effect until the next time you load `nwtrap.nlm`.

IMPORTANT: The `nwalarm.mib` file imports symbols from the Host Resources MIB (RFC1514.MIB), which can also be found in `sys:novell zenworks\mms\mwserver\mibcserver\mibserverpool\mibpool`.

25.4 Managing Servers

With the Management Agent for NetWare and Management Agent for Windows software installed on your NetWare and Windows servers, respectively, you can begin collecting data, receive alarm notifications, remotely manage configuration, and generate reports for managed servers.

Server Management tasks you can perform with Novell ZENworks Server Management include:

- ◆ [Section 25.4.1, “Displaying Server Configuration Information,” on page 970](#)
- ◆ [Section 25.4.2, “Displaying Summary Data,” on page 971](#)
- ◆ [Section 25.4.3, “Viewing Trend Data,” on page 972](#)
- ◆ [Section 25.4.4, “Managing Trend Samplings,” on page 975](#)
- ◆ [Section 25.4.5, “Configuring Server Parameters,” on page 976](#)
- ◆ [Section 25.4.6, “Executing Server Commands,” on page 976](#)
- ◆ [Section 25.4.7, “Management Site Server Status,” on page 978](#)

25.4.1 Displaying Server Configuration Information

Server configuration data is organized in a hierarchical listing expanding down from the server object. You can view information about the server's configuration, memory usage, adapters, network interfaces, disks and disk controllers, volumes, queues, users, connections, open files, NLM files (NetWare), and installed software.

To display server configuration information:

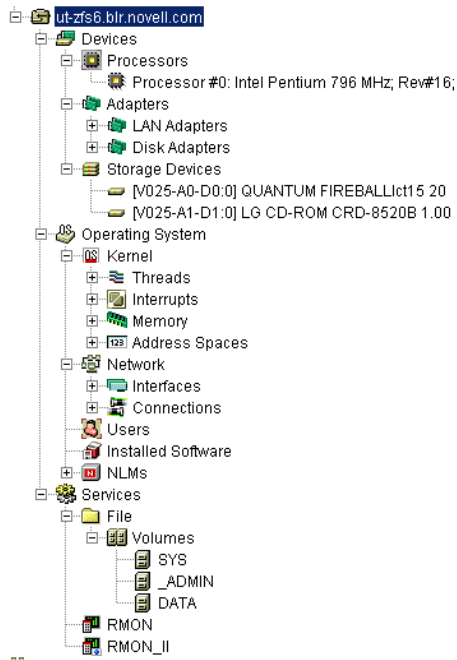

- 1 Locate the server object you want to expand.
- 2 Click the plus sign (+) next to the server object.

The server object opens in the left pane under its parent object and the server contents are displayed. Server data is grouped into the following three categories:

- ◆  Devices
- ◆  Operating System
- ◆  Services

If you are unable to view the above three categories, you must perform probe manageability on the server object. Right-click the server object then select Probe Manageability. The three categories will now be displayed.

- 3 You can drill down into the server configuration farther by clicking the plus signs next to the Devices, Operating System, and Services objects as in the following illustration:

25.4.2 Displaying Summary Data

The Summary View contains tables of statistics obtained by SNMP GET requests to the Management Agent for NetWare and Management Agent for Windows software hosted on managed servers. Statistics are updated dynamically as the server is continually polled for data. Polling utilizes SNMP GET and GET NEXT requests to update the data. You can also control the polling of a selected object by using the stop and refresh functions.

You can view summary data for server, processors, LAN adapters, disk adapters, storage devices, threads, interrupts, memory, address spaces, interfaces, connections, users, installed software, NLM files (NetWare), and volumes. For detailed information about a specific Summary view, see [Section 25.5, “Object Hierarchy and View Details,” on page 978](#).

To display summary information:

- 1 Right-click the object for which you want to view summary data, then click *Views* and then click *Summary*.

The Summary View is displayed.

[Figure 25-7](#) shows the Summary View for a server object. The server summary provides descriptive information including the server's Novell eDirectory name and tree, IP address, RAM, operating system and version, IPX address, subnetwork mask, up time, logged-in users, open files, and status. In addition, the server summary lists all alarms, affected objects, summary, and owner and volume disk space, trend graphs for cache hits and cache buffers. The Summary view displays graphical indicators of the CPU utilization that depicts the average percentage of time that the CPU was not idle for the past minute.

Figure 25-7 Summary View for a Server Object

The screenshot shows the Novell ConsoleOne interface. The left pane displays a tree view with the following structure:

- ut-zfs6.blr.novell.com
 - Devices
 - Operating System
 - Services

The main pane shows the Summary view for a NetWare Server object:

- NetWare Server:** MMS-ALOK
- Tree:** BLR-ALOK
- Description:** Novell NetWare 5.60.03 March 27, 2003
- Location:** 0
- Contact:** Alok'sMachine
- IP Address:** 164.99.149.156 **Subnet Mask:** 255.255.252.0
- Date/Time:** Jul 29, 2004 9:30:44 AM **Up Time:** 0 days and 00:09:24
- Version:** NetWare 6.0 **Total RAM (KB):** 522,624
- Open Files:** 22 **Logged In Users:** 1
- Service Summary:** File **Server Status:** Up
- Server first started:** Jun 21, 2004 6:19:43 PM **Percent Up time:** 32

Below the summary is a table of events:

Severity	Affects...	Summary	Owner	Received Time	Type	Category
Warning	ut-zfs6...	User MMS-ALOK (connection #5) ...	SYSTEM	Thu Jul 29 09:27...	Connection: ...	NetWare-Ser...
Warning	ut-zfs6...	Avg. # of logged-in users exceed...	SYSTEM	Thu Jul 29 09:26...	Threshold - I...	NetWare-Ser...
Warning	ut-zfs6...	NAWT - 1.1 Graphics NLM loaded ...	SYSTEM	Thu Jul 29 09:24...	System: NL...	NetWare-Ser...
Warning	ut-zfs6...	MLIB - Java 1.3 Media Library NLM...	SYSTEM	Thu Jul 29 09:24...	System: NL...	NetWare-Ser...
Warning	ut-zfs6...	XFree86 4.X X11R6 Library Build 0...	SYSTEM	Thu Jul 29 09:24...	System: NL...	NetWare-Ser...
Warning	ut-zfs6...	User admin (connection #11) log...	SYSTEM	Thu Jul 29 09:24...	Connection: ...	NetWare-Ser...

At the bottom, there are three gauges for disk space usage:

- CPU Util (%):** Gauge showing approximately 70% usage.
- SYS:Mounted:** Pie chart showing Free Space 42%, Purgeable space 0%, and Used Space 58%.
- _ADMIN:Mounted:** Pie chart showing Free Space 100%, Purgeable space 0%, and Used Space 0%.
- DATA:Mounted:** Pie chart showing Free Space 43.52%, Purgeable space 0.98%, and Used Space 55.5%.

The status bar at the bottom indicates: More alarms... Total: 100 Selected: 0

25.4.3 Viewing Trend Data

On a server managed by Management Agent for NetWare or Management Agent for Windows, the agents automatically gather trend data on CPU usage, memory usage, and network interface traffic. You can then view current trend data, or historical trend data by hour, day, week, month, or year from Novell ConsoleOne. In this view, the time interval that is being sampled is displayed on the x-axis. The parameter value over the sample period is plotted on the y-axis. Note that the values on the y-axis use the standard abbreviations K (for kilo), M (for mega), and G (for giga). Therefore, a value of 1K would equal 1000; similarly, a value of 1M would equal 1,000,000.

Monitoring trend data helps you with tasks such as setting trend alarm thresholds, determining who is using the server and when the server is used heavily, troubleshooting problems, balancing loads across multiple servers, and planning resources. You can also export trend view data to popular spreadsheet formats for sharing data with others.

You can view trend data for processors, LAN adapters, storage devices, memory, connections, users, and volumes. For information about a specific trend view, see [“Object View Details” on page 979](#).

To view trend statistics:

- 1 Right-click the object for which you want to view trend data then click *Views*, and then click *Trend*.

The Trend View is displayed.

The following sections describe the tasks you can perform using the Trend View:

- ♦ [“Displaying the Legend” on page 973](#)
- ♦ [“Modifying the Time Span” on page 973](#)
- ♦ [“Customizing the Trend View Display” on page 973](#)
- ♦ [“Modifying the Trend View Profile” on page 974](#)

Displaying the Legend

The Trend View legend indicates what each color in the graph represents.

To display the legend:

- 1 Click the *Legend* button  in the Trend View toolbar.

Modifying the Time Span

The Trend View time span specifies what time period the trend graphs represent. By default, a one-hour history is displayed.

To modify the time span:

- 1 Select a time span from the drop-down list in the Trend View toolbar. You can select from the following time spans:
 - ♦ 1 Hour
 - ♦ 1 Day
 - ♦ 1 Week
 - ♦ 1 Month
 - ♦ 1 Year

Customizing the Trend View Display

The Trend View provides several options for customizing the look of the screen. In customizing the view, you can choose from the following options:

- ♦ [“Displaying Grid Lines” on page 973](#)
- ♦ [“Stacking and Unstacking Graphs” on page 974](#)
- ♦ [“Scaling the Y Axis” on page 974](#)

Displaying Grid Lines

By default, the trend charts do not include grid lines.

To display horizontal and/or vertical grid lines:

- 1 To display horizontal grid lines, select the *Horizontal Grid*  button in the Trend View toolbar.
 - 2 To display vertical grid lines, select the *Vertical Grid*  button in the Trend View toolbar.
- Note that you remove the horizontal or vertical grid lines by clicking the same buttons.

Stacking and Unstacking Graphs

By default, all trends are displayed on a single graph with one vertical axis. However, you can customize the view so that each trend is displayed in its own separate graph.

To stack and unstack graphs:

- 1 To display the trends on separate graphs, click the *Strip Chart*  button on the Trend View toolbar.
- 2 To display trends on the same graph, click the *Stack Chart*  button on the Trend View toolbar.

Scaling the Y Axis

To display more useful information on your trend graphs, you may find that you need to modify the scale on the Y axis as follows:

- 1 To increase the scale on the Y axis, click the *Increase Y Axis*  button, which is located to the left of the graph(s).
- 2 To decrease the scale on the Y axis, click the *Decrease Y Axis*  button, which is located to the left of the graph(s).
- 3 To scale the Y axis to fit in the window, click the *Scale to Fit*  button on the Trend View toolbar.

Modifying the Trend View Profile

The Trend View profile represents the set of parameters that are displayed graphically when the Trend View is invoked. You can modify which parameters are displayed in the Trend View by editing the profile.

To edit the profile:

- 1 Click the *Profile* button  in the Trend View toolbar.
The Profile dialog box is displayed. The parameters that are currently displayed in the Trend View for the object are selected.
- 2 Edit the profile by clicking a parameter name to select or deselect it.
You can Shift+click multiple, consecutive parameters and Ctrl+click multiple, non-consecutive parameters.
- 3 Click *OK*.

25.4.4 Managing Trend Samplings

You can customize the parameters of the trend data displayed using the following options:

- ♦ [“Modifying Trend Sampling and Intervals” on page 975](#)
- ♦ [“Modifying Threshold Alarm Settings” on page 975](#)

Modifying Trend Sampling and Intervals

For each trend for which the server agents collect data, you can set sampling intervals and the number of samples stored on the server as follows:

- 1 Right-click the object, then click *Properties*.
- 2 Click the *Trend* tab.
- 3 Select the trend parameter you want to modify, then click *Edit*.
The Edit Trend dialog box is displayed. The trend sampling and interval settings are displayed in the Sampling Parameters section of the screen.
- 4 To enable or disable the sampling parameter, select the appropriate value from the *State* drop-down list.
- 5 To modify the time interval (Sample Interval) at which the trend parameter is sampled, select a value from the *Frequency* drop-down list.
You can select one of 12 possible time intervals from five seconds to one day.
- 6 Specify the duration of time for which to collect samples by entering a value in the *Number of Samples* field.
You determine the duration of time for which a parameter is collected by the number of samples (trend buckets) you specify. You must specify a trend bucket for each sample that is collected over a specific period of time. For more information on setting the number of samples required, see [“Setting the Trend Buckets” on page 965](#).
- 7 When you are done modifying the trend sampling and intervals, click *OK*.

Modifying Threshold Alarm Settings

You can set an alarm threshold for each trend parameter for which the Management Agent for NetWare and Windows, collects data. After you set the alarm threshold, the Management Agent for NetWare sends an alarm to Novell ConsoleOne if the trend crosses the threshold you set.

The Management Agent for NetWare tracks both rising and falling alarm thresholds. Each trend parameter has either a rising or a falling threshold associated with it; the type of threshold cannot be changed.

To change alarm thresholds through Novell ConsoleOne:

- 1 Right-click the object, then click *Properties*.
- 2 Click the *Trend* tab.
- 3 Select the trend parameter for which you want to modify threshold settings, then click *Edit*.
The Edit Trend dialog box is displayed. The threshold alarm settings are displayed in the Rising Alarm Parameters section of the screen.

- 4 To enable or disable the alarm parameter, select the appropriate value from the *State* drop-down list.
- 5 To set or modify the rising threshold, enter a value in the *Rising Threshold* field.
- 6 To set or modify the falling threshold, enter a value in the *Falling Threshold* field.
- 7 When you are done modifying the alarm threshold settings, click *OK*.

25.4.5 Configuring Server Parameters

In order to correct an alarm condition, fine-tune server performance, or fix other problems detected on a server, you need to modify the server configuration. Server configuration can be adjusted from Novell ConsoleOne on any NetWare server hosting the Management Agent for NetWare. SET parameters, usually set at the server console or through a remote console, can be configured from Novell ConsoleOne interface. From Novell ConsoleOne, you can see the current settings, change one or more settings, and confirm your settings before adjustments are sent to the server.

For parameter values and descriptions, see the NetWare server documentation. This information is generally found in the Utilities Reference document.

To view or modify the NetWare SET parameters from Novell ConsoleOne:

- 1 Drill down into the server you want to configure by clicking the *plus sign (+)* next to the server object.
- 2 Right-click the Operating System object, then click *Properties*.
The *Set Parameters* tab is displayed. This tab page lists the NetWare SET parameters and their current values.
- 3 Click the down-arrow icon on the *Set Parameters* tab, then click the category of SET parameters you want to display.
You can choose from the following categories: Communications, Directory Caching, Directory Services, Disk, Error Handling, File Caching, File System, Licensing Services, Locks, Memory, Miscellaneous, Multiprocessor, NCP, Service Location Protocol, Time, or Transaction Tracking.
- 4 Select the parameter you want to modify, then click *Edit*.
The Edit Parameters dialog box is displayed.
- 5 Enter the new parameter value in the appropriate field.
- 6 Indicate when you want the parameter change to take effect by selecting the appropriate radio button from the *Apply Value* box. You can choose to apply the change at the following times:
 - ♦ Now, until reboot
 - ♦ Only after reboot
 - ♦ Now, and after reboot
- 7 Click *OK*.

25.4.6 Executing Server Commands

You can execute the following frequently used NetWare server commands from Novell ConsoleOne.

- ♦ [“Loading and Unloading an NLM” on page 977](#)

- ♦ “Mounting and Dismounting Volumes” on page 977
- ♦ “Clearing a Server Connection” on page 977
- ♦ “Restarting a Server” on page 977
- ♦ “Shutting Down a Server” on page 977

Loading and Unloading an NLM

To load or unload an NLM from Novell ConsoleOne:

- 1 Right-click the NLM object, then select a command from the menu as follows:
 - ♦ To load the NLM, select *Load nlm*.
 - ♦ To unload the NLM, select *Unload nlm*.

Mounting and Dismounting Volumes

To mount or dismount a volume:

- 1 Right-click the volume object, then click *Mount Volume*.
or
Right-click the volume object then click *Dismount Volume*.
The system displays a confirmation box.
- 2 Click *OK*.

Clearing a Server Connection

You can clear a server connection when the server has crashed and left open files on the server or before bringing down the server. This is equivalent to the CLEAR STATION command that you can execute from the server console.

To clear a server connection from Novell ConsoleOne:

- 1 Locate the connection you want to close by expanding the following objects: *Server > Operating System > Network > Connections*.
- 2 Right-click the connection you want to close, then click *Clear Connection*.

Restarting a Server

To restart a server from Novell ConsoleOne:

- 1 Right-click the server object, then click *Restart Server*.

Shutting Down a Server

To shut down a server from Novell ConsoleOne:

- 1 Right-click the server object, then click *Down Server*.

25.4.7 Management Site Server Status

You can now view the status of all the Management and Monitoring Services currently running on the site server.

- 1 Select *Tools > Management Site Server Status*.
- 2 Specify the IP address or the DNS name of the Management Site Server.

NOTE: In case of a clustered environment, specify the IP address of a Shared volume.

- 3 Click *OK*.

The status of your Management Site Server is displayed in the Management Site Server window:

25.5 Object Hierarchy and View Details

When you expand a managed server object, you can view details about the contents of the server. The following sections detail the available objects on a managed server and provide information about the statistical information available in the views for each object:

- ♦ [Section 25.5.1, “Object Hierarchy,” on page 978](#)
- ♦ [Section 25.5.2, “Object View Details,” on page 979](#)

25.5.1 Object Hierarchy

Table 25-4 shows the hierarchy of available objects on a managed server along with their associated icons. For more information about the available views associated with an object, follow the corresponding link.

Table 25-4 Hierarchy of available objects on a managed server along with their associated icons

Category Container	Sub-category Containers	Object Containers	Objects
 Devices	 "Processors" on page 980		 Processor
	 "Printers" on page 997		 Printers
	 "Adapters" on page 983	 LAN Adapters	 Adapter

25.5.2 Object View Details

The following sections provide details about the statistical information available in each object view:

- ♦ "Processors" on page 980
- ♦ "Storage Devices" on page 981
- ♦ "Adapters" on page 983
- ♦ "Threads" on page 984
- ♦ "Interrupts" on page 985
- ♦ "Memory" on page 986
- ♦ "Address Spaces" on page 988

- ◆ “Network” on page 989
- ◆ “Interfaces” on page 990
- ◆ “Connections” on page 991
- ◆ “Users” on page 992
- ◆ “Installed Software” on page 993
- ◆ “NLM” on page 993
- ◆ “Volumes” on page 994
- ◆ “Queues” on page 996
- ◆ “Printers” on page 997
- ◆ “Other Devices” on page 998
- ◆ “Ports” on page 998

Processors

Viewing processor speed helps you analyze and balance loads across servers. Viewing processor utilization data helps you detect problems with utilization and determine when server load is light enough to schedule tasks such as server backups. The server operating system (OS) automatically determines the CPU speed and is reported based on the OS data.

Processor speed is a major determinant of server performance. Therefore, it is important to know the processor speed of your servers when analyzing server load and balancing load across multiple servers. For example, one server might be handling twice as many users as another, but if the processor is twice as fast, the load might still be distributed correctly.

You should maintain a baseline of processor utilization for a server so that you can recognize when a server's processor utilization is higher than normal.

You can display the following views of information about the processors on your managed servers:

- ◆ “Processors Summary View” on page 980
- ◆ “Processor Summary View” on page 981
- ◆ “Processors Trend View” on page 981

Processors Summary View

You can access the **Summary View** for the Processors object container after expanding the following server objects: *Devices > Processors*. This view displays the following information for each processor object in the container:

- ◆ `Processor Number`: A unique number assigned to the processor.
- ◆ `Status`: The status of the processor is either online or offline.

The following statistics are displayed only if the processor is online:

- ◆ `Utilization %`: Processing load on this processor for the last second, expressed as a percentage.
- ◆ `Interrupts Processed`: Number of interrupts fired on this processor in the last second.

- ◆ **Time Spent in Interrupts Last Second, in Microseconds:** The amount of time in microseconds that the processor spent processing interrupts in the last second.
- ◆ **Number of Bound Threads:** The number of threads that have been bound to this processor. Threads that are bound to a processor run only on that processor. Unbound threads can be migrated from one processor to another when required.

Processor Summary View

You can select the **Summary View** for an individual processor after expanding the following server objects: *Devices > Processors > processor #x*. This view displays the following information:

- ◆ **Processor Number and Status:** A unique number assigned to the processor along with its current status. The status can be online or offline.

The following statistics are displayed only if the processor is online.

- ◆ **Utilization %:** The processing load on this processor for the last second, expressed as a percentage.
- ◆ **Interrupts Processed:** The number of interrupts fired on this processor in the last second.
- ◆ **Time Spent in Interrupts Last Second, in Microseconds:** The amount of time in microseconds that the processor spent processing interrupts in the last second.
- ◆ **Number of Bound Threads:** The number of threads that have been bound to this processor. Threads that are bound to a processor run only on that processor. Unbound threads can be migrated from one processor to another when required.

Processors Trend View

You can access the **Trend View** for the Processors object container after expanding the following server objects: *Devices > Processors*. This view displays the following graph for each processor:

- ◆ **CPU Utilization (avg. %):** The processing load on the processor for the last second, expressed as a percentage. This information is displayed only if the processor is online.

Storage Devices

You can get detailed information about the disk drives in a managed server, including disk size in megabytes, disk types, block size, and so on.

You can also view partition information for each disk drive. Partition information is especially informative because you can determine whether a partition is fault tolerant and whether the hard disk is losing data integrity.

Fault tolerance of a NetWare partition is part of the detailed information provided by Novell ZENworks Server Management. To determine whether a hard disk is losing data integrity, examine the redirected area. A number in the redirected area indicates the number of data blocks that have been redirected to the Hot Fix Redirection Area to maintain data integrity. The higher the redirected area number, the more faulty blocks there are on the hard disk. A redirected area growing over a period of time indicates a hard disk going bad.

On a NetWare server managed by the Management Agent for NetWare or a Windows server managed by the Novell ZENworks Server Management agent, the Agent automatically gathers trend data on CPU usage, memory usage, and network interface traffic. In Novell ZENworks Server Management, you can view current trend data, or historical trend data by hour, day, month, or year.

Monitoring trend data helps you with tasks such as setting alarm thresholds, determining who is using the server and when the server is used heavily, troubleshooting problems, balancing loads across multiple servers, and planning resources.

You can display the following views of information about the storage devices on your managed servers:

- ◆ “Storage Devices Summary View” on page 982
- ◆ “Storage Device Summary View” on page 982
- ◆ “Storage Devices Trend View” on page 983

Storage Devices Summary View

You can select the **Summary View** for the Storage Devices container object after expanding the following server objects: *Devices* > *Storage Devices*. This view provides the following information for each storage device on the server:

- ◆ **Disk Name**: The name of the disk drive.
- ◆ **Size (KB)**: The total size of the disk drive in kilobytes.
- ◆ **Access**: Whether the disk drive is readable and writable or just readable.
- ◆ **Status**: Whether the disk drive is operational.
- ◆ **Type**: The type of media. Media types can include hard disk, floppy disk, tape, optical disk (read-only, write once read many, and read/write), or RAM disk. If unidentifiable, other or unknown is listed in this field.
- ◆ **Driver Description**: The name of the driver used by the disk drive.
- ◆ **Block Size**: The amount of blocks used on the disk in kilobytes.
- ◆ **Heads**: the number of read/write heads on the disk drive.
- ◆ **Cylinders**: The number of cylinders on the disk drive.
- ◆ **Sectors/Track**: The number of sectors per track on the disk drive.
- ◆ **SCSI Target ID**: The target address for SCSI controllers or the unit number for other devices and the logical unit number for SCSI devices or the number zero for other devices.

Storage Device Summary View

You can display the **Summary View** for an individual storage device by expanding the following server objects: *Devices* > *Storage Devices* > *storage_device_x*. This view displays the following information:

- ◆ **Disk Name**: Name of the disk drive.
- ◆ **Logical ID**: The number assigned to a logical partition for identification.
- ◆ **Physical ID**: The number assigned to a physical partition for identification.
- ◆ **Type Partition**: The type of partition, including DOS, NetWare, and UNIX* partitions.
- ◆ **Size (KB)**: The size of the partition, in kilobytes.
- ◆ **Redirection Area**: The size of the entire Hot Fix Redirection Area.
- ◆ **Redirected Area**: The number of bad blocks Hot Fix found.

- ◆ **Reserved Area:** The number of Hot Fix redirection blocks reserved for system use.
- ◆ **Fault Tolerance:** The type of fault tolerance used. The possible fault tolerance types are duplex and mirrored. If there is no fault tolerance, this field contains the value None.

Storage Devices Trend View

You can select the Storage Devices **Trend View** after expanding the following server objects: *Devices > Storage Devices*. This view provides the following information:

- ◆ **File System Reads (#/min):** Depicts the number of file system reads made per minute on multiple or single storage devices.
- ◆ **File System Writes (#/min):** Depicts the number of file system writes made per minute on multiple or single storage devices.
- ◆ **File System Reads (KB/min):** Depicts the number of file system reads per kilobyte volume made on multiple or single storage devices.
- ◆ **File System Writes (KB/min)** Depicts the number of file system writes per kilobyte volume made on multiple or single storage devices.
- ◆ **Free Redirection Area (%) :** Depicts the percentage of total volume allocated to the disk redirection area.

Adapters

You can get detailed information about the network and disk adapters in a managed server, including I/O port, memory address, and interrupt configuration.

You can use this data to detect configuration problems such as the same address or interrupt is configured for two boards inside the server, or for a board and a component of the server's hardware. No two boards can use the same I/O port, memory address, and interrupt.

Problems with LAN adapters cause network problems, such as servers and workstations not being able to communicate. You can use the data collected on the LAN adapter to determine whether the frame type used by a network board is bound to a supported protocol. (A single network board might be bound to several protocols.)

You can immediately tell whether a problem is due to something as simple as using the wrong frame type on the workstation (for example, an Ethernet_II frame type on the server and the Ethernet_802.2 frame type on the workstation).

You can display the following views of information about the adapters on your managed servers:

- ◆ **“Adapters Summary View” on page 983**
- ◆ **“Adapters Trend View” on page 984**

Adapters Summary View

You can select the Adapters **Summary View** after expanding the following server objects: *Devices > Adapters > adapter_x*. This view provides the following information:

- ◆ **Description:** The type of adapter hardware. This field can include the following types of information: manufacturer, model, and version. Or, for network boards, this field may contain a short board name and the board's burned-in MAC address.
- ◆ **Type:** The type of adapter (for example, network card or disk storage).

- ◆ **Devices Attached:** The number of devices associated with an adapter (for example, the number of drives attached to the disk controller).
- ◆ **Driver Description:** Description of the driver for this adapter.
- ◆ **Version:** The version number of the driver software.
- ◆ **Interrupt Number:** The unique interrupt number used by the adapter.
- ◆ **I/O Port:** The unique I/O port block used by the adapter.
- ◆ **Memory:** The unique memory address space used by the adapter.
- ◆ **DMA:** The Direct Memory Access (DMA) Channel used by the adapter.
- ◆ **Slot:** The slot in which the adapter is installed.

Adapters Trend View

You can select the Adapters **Trend View** after expanding the following server objects: *Devices > Adapters > adapter_x*. This view provides the following graphs:

- ◆ **LSL Packets Received:** Depicts the number of LSL packets received by the adapter.
- ◆ **LSL Packets Transmitted:** Depicts the number of LSL packets transmitted by the adapter.
- ◆ **Packets Received:** Depicts the total number of packets received by the adapter.
- ◆ **Packets Transmitted:** Depicts the total number of packets transmitted by the adapter.

Threads

You can display information for all threads currently running on a managed server. A thread is recognized as an independent unit of execution.

You can display the following view of information about the threads on your managed servers:

- ◆ **“Threads Summary View” on page 984**

Threads Summary View

You can select the Threads **Summary View** after expanding the following server objects: *Operating System > Kernel > Threads*. This view provides the following information:

- ◆ **Name:** The application thread name.
- ◆ **Share Group:** The Application share groups and their associated threads and shares.
- ◆ **Parent Module:** Module (NLM) associated with this thread.
- ◆ **State:** The state of the thread, which can be one of the following: initializing, invalid, ready, running, suspended, terminated, or zombie.
- ◆ **Suspended Due To:** Reason the thread is suspended. If the thread is not in a suspended state, this field is blank.
- ◆ **Execution Time, Microseconds:** Amount of time in the last second that the processor spent executing the thread's code.
- ◆ **Stack Size, Bytes:** Size of the thread's stack.

- ◆ **Soft Affinity:** Processor on which the thread preferentially executes, but from which it can migrate when necessary.
- ◆ **Hard Affinity:** Indicates whether the thread is explicitly bound to a specified processor for the thread's lifetime. If the thread runs only on a specified processor, it is able to exploit the processor's cache state. If the thread is allowed to run on any available processor, the field value is zero.

Interrupts

You can display information for the registered interrupts on a managed server. On a multiprocessing system, interrupt information is displayed for all processors combined and individually for each online processor.

You can display the following views of information about the interrupts on your managed servers:

- ◆ [“Interrupts Summary View” on page 985](#)
- ◆ [“Interrupts Service Routines View” on page 985](#)

Interrupts Summary View

You can select the Interrupts **Summary View** after expanding the following server objects: *Operating System > Kernel > Interrupts*. This view provides the following information:

- ◆ **Name:** The name of the interrupt routine.
- ◆ **Interrupt Number:** Number for this service routine.
- ◆ **Processor:** Number of the processor.
- ◆ **Type:** The type of interrupt service routine. It can be one of the following:
 - ◆ **Bus:** A device I/O interrupt that is used (for example, by disk or LAN drivers).
 - ◆ **Local:** A hardware platform-specific interrupt local to an individual processor.
 - ◆ **System:** An interrupt category that is reserved for systems with unique interrupt requirements.
 - ◆ **Interprocessor:** An interrupt that is generated by one processor to affect another processor.
 - ◆ **Timer:** An interrupt that provides timer services for the OS as well as preemption support. (In multiprocessing systems, timer interrupts are local to a processor.)
- ◆ **Service Routines:** Number of service routines that are launched when this interrupt occurs.
- ◆ **Interrupt Occurrences:** Number of times in the last second that the interrupt occurred and was processed.
- ◆ **Execution Time:** Amount of time in the last second that the processor spent processing this interrupt.
- ◆ **Spurious Interrupts:** Number of times since the server started that an interrupt fired that should not have occurred.

Interrupts Service Routines View

The Interrupts Service Routines View provides information about the memory address spaces defined on the server.

NetWare runs in the OS address space (kernel), along with LAN drivers, storage device drivers, MONITOR, and Server Management Agents. OS address space is backed by physical memory.

All other address spaces are user space (ring 3) and are backed by virtual memory. Applications running in user space cannot cause the server to abend if the address space faults.

You can select the Service Routines View after expanding the following server objects: *Operating System > Kernel > Interrupts*. This view provides the following information:

- ◆ **Name**: The name of the interrupt service routine.
- ◆ **Service Routine Number**: Service Routine Number associated with this service routine.
- ◆ **Processor Number**: Processor number this routine is running on.
- ◆ **Interrupt Number**: Interrupt number associated with this service routine.
- ◆ **Interrupts Processed Last Second**: Number of interrupts that were processed by the ISR during the last second.

Memory

You can display the following views of information about the memory on your managed servers:

- ◆ [“Memory Summary View” on page 986](#)
- ◆ [“Memory Trend View” on page 986](#)
- ◆ [“Disk Cache View” on page 987](#)
- ◆ [“Virtual Memory View” on page 988](#)

Memory Summary View

You can select the Memory **Summary View** after expanding the following server objects: *Operating System > Kernel > Memory*. This view provides the following information:

- ◆ **Type**: The type of memory (for example, DOS, allocated memory, cache buffers, or code and data memory).
- ◆ **Unit Size (bytes)**: The size of the memory allocation.
- ◆ **Total (KB)**: The number of memory units × the unit size.
- ◆ **Units Used**: The number of memory units that have been allocated.
- ◆ **Used (KB)**: The number of KB of memory that has been allocated.

The Memory Summary View also provides a pie chart depicting memory usage on the system.

Memory Trend View

You can select the Memory **Trend View** after expanding the following server objects: *Operating System > Kernel > Memory*. This view provides the following graphs:

- ◆ **Cache Buffers (%)**: The percentage of memory allocated to cache buffers.
- ◆ **Code and Data Memory (%)**: The percentage of memory allocated to code and data.
- ◆ **Allocated memory (%)**: The amount of allocated memory.
- ◆ **Dirty Cache Buffers (%)**: The amount of dirty cache buffer memory.

Disk Cache View

This view displays utilization for disk cache memory. Use cache utilization statistics to determine when you need to install more RAM for cache. You can select this view after expanding the following server objects: *Operating System > Kernel > Memory*. It provides the following information:

- ◆ **Short Term Cache Hits %:** Percentage of requests in the last second for disk blocks that were already in cache memory. When the requested data is already in memory, disk reads don't need to be made. If this value falls below 98%, consider installing more RAM for cache. Also compare with Long Term Cache Hits.
- ◆ **Short Term Cache Dirty Hits %:** Percentage of requests in the last second for disk blocks that were already in cache memory but were dirty. Dirty cache must be written to disk before being used. Also check Long Term Dirty Cache Hits and LRU Sitting Time.
- ◆ **Long Term Cache Hits %:** Cumulative percentage of requests for disk blocks that were already in cache. When the requested data is already in memory, disk reads don't need to be made. Use this cumulative percentage to assess overall disk cache utilization. If this value falls below 90%, install more RAM for cache.
- ◆ **Long Term Cache Dirty Hits %:** Cumulative percentage of requests for disk blocks that were already in cache memory but were dirty. (Before dirty cache can be used, it must be written to disk.) Use this cumulative percentage to assess overall disk cache utilization. If this value is high or steadily incrementing, add more RAM for cache. Also check LRU Sitting Time.
- ◆ **Total Cache Blocks Allocated:** Cumulative number of requests for disk cache blocks that have been made since the server was started or rebooted. This value is the sum of the values of Allocated from Available List and Allocated from Least Recently Used (LRU). If the value of Allocated from Available is much higher, the server has sufficient RAM for cache. If the value of Allocated from LRU is high, install more RAM for cache.
- ◆ **Cache Blocks Allocated from Available List:** Number of requests for disk cache blocks that were filled by blocks in the available list (blocks that were not being used). When there are no free blocks available, requests are filled from the LRU list of cache blocks. If this value is much higher than the Allocated from LRU value, the server has sufficient RAM for cache.
- ◆ **Cache Blocks Allocated from LRU:** Number of requests for disk cache blocks that were filled by blocks from the Least Recently Used cache blocks. The system writes pending requests from the LRU cache block to disk then frees the block for the current request. Because LRU caches used only when no other cache is available, a steadily incrementing count indicates more RAM is needed.
- ◆ **Number of Times in Last 10 Minutes that the OS Had to Wait:** Number of times in the last 10 minutes that the OS waited for an LRU block in order to fulfill a request. If this value is greater than 7, install more RAM for cache.
- ◆ **Number of Times OS Had to Wait:** Number of times that the OS waited for an LRU block in order to fulfill a request.

- ◆ **Total Number of Times the Write Request Was Delayed:** Number of times a write request was delayed because there were too many writes to perform or because the disk channel was busy. A high value indicates either that the disk channel has too much I/O traffic or that you need to install more RAM for cache.
- ◆ **Number of Times the Request Was Re-tried:** Number of times a disk cache request had to be retried because the target block was being used. If this value is high or steadily incrementing, install more RAM for cache.

Virtual Memory View

This view displays information about the virtual memory system. Use these statistics to monitor the efficiency of server memory usage. If these values are fairly stable over time and if server performance is satisfactory, the server has adequate memory for its load. For example, if the value of Page faults increases, this indicates that the server performance is degrading. Conversely, if the Free swap pages value increases, it is an indication of better server performance.

You can select this view after expanding the following server objects: *Operating System > Kernel > Memory*. It provides the following information:

- ◆ **Total Page-In Requests:** Number of requests that were made to move virtual memory from swap files since the server was started (server up time).
- ◆ **Page-In Requests in Last 5 Seconds:** Number of requests to move 4 KB virtual memory pages from swap files.
- ◆ **Total Page-Out Requests:** Number of requests that were made to move virtual memory to swap files since the server was started (server up time).
- ◆ **Page-Out Requests in Last 5 Seconds:** Number of requests to move 4 KB virtual memory pages to swap files.
- ◆ **Total Swap Pages:** Number of 4 KB pages in this server's virtual memory system. (The size of the swap file in memory pages is the total number of bytes divided by 4 KB.) The size of the swap file grows or shrinks dynamically to match the memory requirements of the server's load.
- ◆ **Free Swap Pages:** Number of 4 KB pages that are available for use by the virtual memory system.
- ◆ **Reserved Swap Pages:** Number of 4 KB pages that are reserved by the virtual memory system.
- ◆ **Total Page Faults:** Number of times the virtual memory system retrieved from the swap file since the server was started (server up time).
- ◆ **Page Faults in Last 5 Seconds:** Number of times in the last five seconds that the virtual memory system retrieved from the swap file. (This means that accessed memory wasn't backed by physical memory.)

Address Spaces

NetWare runs in the OS address space (kernel) along with LAN drivers, storage device drives, MONITOR, and Server Management Agents. OS address space is backed by physical memory.

All other address spaces are user space (ring 3) and are backed by virtual memory. Applications running in user space cannot cause the server to abend if the address space faults.

You can display the following view of information about address spaces on your managed servers:

- ◆ [“Address Spaces Summary View” on page 989](#)

Address Spaces Summary View

You can select the Address Spaces [Summary View](#) after expanding the following server objects: *Operating System > Kernel > Address Spaces*. This view provides the following information:

- ◆ **Name**: Name of the virtual memory address space where this module runs.
- ◆ **Number of NLMs Loaded**: Count of NLM programs loaded in this address space. NetWare, LAN drivers, storage device drivers, MONITOR, and Server Management Agents are loaded in OS address space (kernel). A server application, such as GroupWise[®], Lotus Notes*, or an Oracle* database, can be loaded in its own address space (user space or ring 3).
- ◆ **Mapped Pages**: Total number of physical memory pages backing this address space. Note that the OS address space (kernel) is the only address space backed by physical memory.
- ◆ **Restarted**: Total number of times this address space faulted and restarted automatically. A value of zero (0) indicates that no fault has occurred. A non-zero value indicates that an address space has faulted and recovered. Follow online Troubleshooting documentation for core dump instructions for address spaces.
- ◆ **Memory in Use, Bytes**: Amount of allocated memory in use.
- ◆ **Memory Not in Use, Bytes**: Amount of unused allocated memory.
- ◆ **Memory As Overhead, Bytes**: Amount of memory used for managing the allocation pool plus the amount of memory fragmentation.
- ◆ **Total Blocks**: Number of memory blocks that are in use and that are available at the request of the NLM.
- ◆ **Blocks in Use**: Number of memory blocks that were allocated and used.
- ◆ **Block Not Used**: Number of memory blocks that were allocated but not used.

Network

You can display the following view of information about the network activity on your managed server:

- ◆ [“Network Trend View” on page 989](#)

Network Trend View

You can access the [Trend View](#) for the Network object container after expanding the following server objects: *Operating System > Network*. This view displays the following graph for each network adapter:

- ◆ **Packets Received (KB/min)**: The number of kilobytes received by the adapter for the last minute.

Interfaces

You can display the following view of information about the network interfaces on your managed server:

- ◆ “[Interfaces Summary View](#)” on page 990
- ◆ “[Interfaces Statistics View](#)” on page 990

Interfaces Summary View

You can access the [Summary View](#) for the Network object container after expanding the following server objects: *Operating System > Network > Interfaces*.

This view displays the following information:

- ◆ **Frame Type:** The frame type that is bound to this logical board.
- ◆ **MAC Address:** The MAC address of the interface.
- ◆ **Description:** Text describing the interface board.
- ◆ **Line Speed:** The number of bits per second transmitted on this board.
- ◆ **Type:** The type of interface (for example, Ethernet CSMACD).
- ◆ **Logical Board #:** The number assigned to this logical board.
- ◆ **Logical Board Name:** The name assigned to this logical board.
- ◆ **Protocols:** The protocols to which the logical board is bound (for example, IP, ARP, or IPX).

Interfaces Statistics View

You can access the Statistics View for the Network object container after expanding the following server objects: *Operating System > Network > Interfaces*.

This view displays the following information:

- ◆ **Frame Type:** The frame type that is bound to this logical board.
- ◆ **MAC Address:** The MAC address of the interface.
- ◆ **MTU:** The size of the largest datagram which can be sent/received on the interface.
- ◆ **Admin Status:** The desired state of the interface.
- ◆ **Oper Status:** The current operational state of the interface.
- ◆ **Bytes In:** The total number of bytes received on the interface.
- ◆ **Bytes Out:** The total number of octets transmitted out of the interface.
- ◆ **Ucast Packets In:** The number of subnetwork-unicast packets delivered to a higher-layer protocol.
- ◆ **Ucast Packets Out:** The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address.
- ◆ **Nucast Packets In:** The number of non-unicast packets delivered to a higher-layer protocol.
- ◆ **Nucast Packets Out:** The total number of packets that higher-level protocols requested be transmitted to a non-unicast address.
- ◆ **Discards In:** The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.

- ◆ **Discards Out:** The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted.
- ◆ **Errors In:** The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.
- ◆ **Errors Out:** The number of outbound packets that could not be transmitted because of errors.
- ◆ **Unknown Protocols In:** The number of packets received via the interface which were discarded because of an unknown or unsupported protocol.

The Clear Counters button in this view resets the values only on the Management Console and not on the Server. This is done to enable the user to get the current data from the server.

Connections

You can display the following views of information about the connections on your managed server:

- ◆ [“Connections Summary View” on page 991](#)
- ◆ [“Connections Trend View” on page 992](#)
- ◆ [“Open Files View” on page 992](#)

Connections Summary View

The Connections **Summary View** displays information and statistics for the connections on the selected server. For example, this view displays the number of files currently being accessed by the server and by other clients. Certain files, such as hidden files that support Novell eDirectory, are always open. You can select this view after expanding the following server objects: *Operating System > Network > Connections > connection_x*.

This view provides the following information:

- ◆ **Connection# Login Name:** A string indicating the connection number and login name. Note that connection 0 (zero) is used by the system. The login name is the Novell eDirectory full distinguished name where applicable.
- ◆ **Client Address:**
 - IP: *xxx.xxx.xxx.xxx:port number*
 - IPX: *network:node:socket*
- ◆ **Connection Time:** The date and time the connection was established.
- ◆ **Privileges:** A connection can have one or more of the following privileges:
 - ◆ Supervisor
 - ◆ Operator
 - ◆ Auditor
 - ◆ High_Privilege
 - ◆ Second_Authentication
 - ◆ Second_High_Privilege
- ◆ **Status:** The status can be one of the following:
 - ◆ Not logged in
 - ◆ Logged in

- ◆ Need security change
- ◆ MacStation
- ◆ Connection abort
- ◆ Audited
- ◆ Authenticated temporary
- ◆ Audit connection recorded
- ◆ DS audit connection recorded
- ◆ Logout in progress
- ◆ Read (bytes) : Number of bytes the connection has read since it was established.
- ◆ Written (bytes) : Number of bytes the connection has written since it was established.
- ◆ NCP Requests : Number of NCP requests the connection has made since it was established.
- ◆ Open Files : Number of files that are currently opened by the connection.
- ◆ Locked Records : Number of file records that are currently locked by the connection.

Connections Trend View

You can select the Connections **Trend View** after expanding the following server objects: *Operating System > Network > Connections > connection_x*. This view provides the following graphs:

- ◆ Connections (avg. #) : The average number of connections over the last sample interval.

Open Files View

The Connection Open Files View displays information and statistics for the connection on the server. For example, this view displays the number of files currently being accessed by the server and by other clients. Certain files, such as hidden files that support Novell eDirectory, are always open. You can select this view after expanding the following server objects: *Operating System > Network > Connections > connection_x*. This view provides the following information:

- ◆ Filename : The name of the open file, including the directory path.
- ◆ Login Name : The name of the user (if any) who opened the file. If the file was opened by the system or by an NLM, the Login Name will be a zero-length string.
- ◆ Volume Name : The physical name of the NetWare volume containing the open file.
- ◆ Directory Number : A number that uniquely identifies an open file within a NetWare volume.
- ◆ Volume ID : A number that uniquely identifies a NetWare volume. The value of this object for a particular volume has the same value as the nwVolID object for the same volume.

Users

You can display the following views of information about the users on a selected server:

- ◆ “Users Summary View” on page 993
- ◆ “Users Trend View” on page 993

Users Summary View

The Users **Summary View** provides information about the users who access the selected server. You can select this view after expanding the following server objects: *Operating System > Users*. This view provides the following information about each user:

- ◆ **Login Name:** The login name of the user.
- ◆ **Disk Usage:** The amount of disk space the user has used.
- ◆ **Last Login:** The date the user last logged in to the server.
- ◆ **Account Status:** Indicates whether the user account is valid.
- ◆ **Password:** Indicates whether the user's password is valid.
- ◆ **Real Name:** The user's Novell eDirectory real name.
- ◆ **Bad Login:** The number of failed login attempts for the user. The number 65535 displayed in this view indicates that you have exhausted the maximum number of attempts to login.
- ◆ **Bad Login Address:** The network address of the location from which the user login failed, if any.

Users Trend View

The Users **Trend View** provides information about the users who access the selected server. You can select this view after expanding the following server objects: *Operating System > Users*. This view provides the following graph:

- ◆ **Logged-In Users (avg. #):** Depicts the average number of users logged in to the server.

Installed Software

You can display the following view of information about the software that is installed on a selected server:

- ◆ **“Installed Software Summary View” on page 993**

Installed Software Summary View

The Installed Software **Summary View** provides information about the software installed on the selected server. You can select this view after expanding the following server objects: *Operating System > Installed Software*. This view provides the following information:

- ◆ **Name:** The name of the installed software module.
- ◆ **Type:** The type of software (for example, device drivers, applications, or operating system).
- ◆ **Date Installed:** The date the software was installed.

NLM

You can display the following views of information about the NLM software on a managed server:

- ◆ **“NLM Summary View” on page 994**
- ◆ **“Resource Tag View” on page 994**

NLM Summary View

The NLM **Summary View** provides information about a selected NLM. You can select this view after expanding the following server objects: *Operating System > NLMs > nlm_x*. This view provides the following information:

- ◆ **Name**: The name of the NLM.
- ◆ **Version**: The version number of the NLM.
- ◆ **Released**: The date and time the NLM was released.
- ◆ **Memory (bytes)**: The total memory in bytes used by this NLM. This is a composite total of short term memory, semi-permanent memory, and non-movable memory, cache memory allocated by the NLM plus the sizes of the code, and data sections of this instance of an NLM.
- ◆ **Description**: A text string that describes the NLM.
- ◆ **Copyright**: The copyright string for the NLM.

Resource Tag View

You can select the NLM Resource Tag View after expanding the following server objects: *Operating System > NLMs > nlm_x*. This view provides the following information:

- ◆ **Description**: The name that the owning module assigned to this resource tag.
- ◆ **Number in Use**: The number of instances of the resource tag.
- ◆ **Resource Type**: The type of resource tag that is being tracked (for example, semaphores or processors).
- ◆ **Address Space**: Name of the address space where the module that owns the resource tag is running.

Volumes

NetWare server disk storage space is divided into volumes. You can view various data about the volumes mounted on a server, such as size, free space, how the volumes are distributed across disks, and which users are using the space. For individual volumes you can view data on configuration, open files, segments, and usage. The available views of data include:

- ◆ **“Volume Summary View”** on page 994
- ◆ **“Volume Trend View”** on page 995
- ◆ **“Open Files View”** on page 995
- ◆ **“Volume Segment View”** on page 996
- ◆ **“Volume Usage View”** on page 996

Volume Summary View

The Volume **Summary View** provides details about a single volume. You can select this view after expanding the following server objects: *Services > File > Volumes > volume_x*. This view provides the following information:

- ◆ **Size (KB)**: The size of the volume in kilobytes.

- ◆ **Free (KB)** : The amount of free space on the volume in kilobytes. As files are added or expanded, this number approaches zero. A pie chart shows you how much of the total volume size is free.
- ◆ **Used (KB)** : The amount of space, which is determined by subtracting the free disk space from the total volume size.
- ◆ **Status** : Whether the volume is mounted. If the volume is not mounted, only the volume name is listed.
- ◆ **Namespaces** : Namespaces that are supported on the volume. Namespaces supported are DOS, Macintosh*, NFS*, FTAM, and OS/2*.
- ◆ **Attributes** : Attributes of the volume. Possible attributes are block sub-allocation, file compression, data migration, auditing, and read-only. A volume can have a combination of attributes, such as read-only volume with block sub-allocation.
- ◆ **# Logical Segment** : The number of segments comprising this volume.
- ◆ **DS Name** : The volume's full Directory Services distinguished name or a zero-length string if not applicable.
- ◆ **Non-Purgable** : The amount of space (in kilobytes) taken by the deleted files whose purge dates have not yet expired. Non-purgable space can be reclaimed as free space when the deleted files become eligible to be purged.
- ◆ **Block Size** : The block size on the volume in bytes.
- ◆ **Dir Slots** : The total number of directory table entries available on the volume.
- ◆ **Used Dir Slots** : The number of directory table entries that are currently in use.
- ◆ **File System Name** : The type of file system on the volume is either remote or local. The File System Name value is listed only if the volume is remote. In this case, the file system name is the remote mount point; for example, SITE1:/usr/x.

Volume Trend View

You can select the Volume **Trend View** after expanding the following server objects: *Services > File > Volumes > volume_x*. This view provides the following graph:

- ◆ **Volume % Free Space** : The percentage of space still available on the volume.

Open Files View

The Volume Open Files View displays a table of all open files on the volume. If it is opened by more than one connection, multiple entries for the same file will appear in the table. You can select the Open Files View after expanding the following server objects: *Services > File > Volumes > volume_x*. This view provides the following information:

- ◆ **Filename** : The name of the open file, including the directory path.
- ◆ **Connection #** : The number of the connection that opened the file.
- ◆ **Login Name** : The name of the user (if any) who opened the file. If the file was opened by the system or by an NLM, the Login Name will be a zero-length string.
- ◆ **Directory Number** : A number that uniquely identifies an open file within a NetWare volume.
- ◆ **Volume ID** : A number that uniquely identifies a NetWare volume.

Volume Segment View

The Volume Segment View provides information about the segments on a volume. You can select this view after expanding the following server objects: *Services > File > Volume > volume_x*. As long as the Volume Segment View is displayed, the server is polled for data and the view is constantly updated with real-time information. This view provides the following information about each segment on the selected volume:

- ◆ **ID:** The number assigned to the volume segment for identification.
- ◆ **Logical Partition ID:** The number assigned to a logical partition for identification.
- ◆ **Physical Partition ID:** The number assigned to a physical partition for identification.
- ◆ **Size:** The size of the segment.
- ◆ **Fault Tolerance:** The type of fault tolerance used on the segment. Possible types are duplex and mirrored. If there is no fault tolerance, the value is None.
- ◆ **Disk Drive:** The name of the disk drive on which the segment resides.

Volume Usage View

The Volume Usage View provides information about the amount of volume space in use per user. As long as the Volume Usage View is displayed, the server is polled for data and the view is constantly updated with real-time information. You can select this view after expanding the following server objects: *Services > File > Volumes > volume_x*. This view provides the following information per volume user:

- ◆ **Used KB:** Number of kilobytes currently in use.
- ◆ **Limit KB:** Number of kilobytes to which a user is limited.
- ◆ **Username:** The user's login name.

Queues

You can display the following views of information about the queues on a managed server:

- ◆ [“Queues Summary View” on page 996](#)
- ◆ [“Queue Summary View” on page 997](#)
- ◆ [“Queue Trend View” on page 997](#)

Queues Summary View

The Queues **Summary View** provides the following information about the print queues on the managed server:

- ◆ **Queue Name:** The name of the queue.
- ◆ **Type:** The type of queue (for example, archive queue, job queue, or print queue).
- ◆ **# Jobs:** The number of print jobs in the queue currently.
- ◆ **# Print Servers:** The number of print servers serviced by the queue.
- ◆ **Volume:** The volume where the queue resides.
- ◆ **Add Job State:** Indicates whether or not the queue can add jobs.
- ◆ **Attach State:** Indicates whether or not the queue can attach.

Queue Summary View

The Queue **Summary View** provides the following information about the print jobs in the selected queue:

- ◆ **Job #:** A unique number assigned to the print job.
- ◆ **Position:** The print job's order in the print queue.
- ◆ **Bytes:** The number of bytes to be printed.
- ◆ **Description:** A description of the print job.
- ◆ **User:** The username of the user who submitted the job.
- ◆ **Entry Time:** The time the job was added to the queue.
- ◆ **Control Flags:** A value representing the control flags for the job. For example, some possible control flags are service auto start, execute, user hold, or operator hold.
- ◆ **Target Time:** The date and time the job is to be printed.
- ◆ **Target Server:** The target server for the job.
- ◆ **Actual Server:** The name of the server currently processing the job.

Queue Trend View

The Queues **Trend View** provides the following graph for each queue on the managed server:

- ◆ **Wait Time of Next Ready Job (sec):** The average length of time the next job waits in the queue.

Printers

You can get the detailed information about the printers installed in a managed server, including printer name, port, driver and description, status, error conditions, etc. You can display the following views of information about the printers on your managed servers:

- ◆ **“Printer Console View”** on page 997
- ◆ **“Printer Summary View”** on page 997

Printer Console View

You can access the Console View for the Printers object container after expanding the following server objects: *Devices* > *Printers*. This view displays the following information for each printer object in the container:

- ◆ **Printer Name:** Name of the printer

Printer Summary View

You can display the Summary View for an individual printer by expanding the following server objects: *Devices* > *Printer* > *printer_x*. This view displays the following information:

- ◆ **Printer Name:** The name of the printer

- ◆ Printer Status: The current status of this printer device. The status can be idle, printing, warm-up, or unknown state.
- ◆ Error Condition: The error conditions include lowPaper, noPaper, lowToner, noToner, doorOpen, jammed, offline, or serviceRequested.

Other Devices

From this view, you can get other devices like the keyboard and the mouse installed on a managed server.

- ◆ [“Other Devices on Console View” on page 998](#)

Other Devices on Console View

This displays other devices like the keyboard and the mouse.

The information about the keyboard includes:

- ◆ Keyboard Name
- ◆ Keyboard Type
- ◆ Driver Name
- ◆ Class
- ◆ Bus Type

The information about the mouse includes:

- ◆ Mouse Name
- ◆ Mouse Type
- ◆ Driver Name
- ◆ Class
- ◆ Bus type

Ports

From this view, you can install serial ports and parallel ports on a managed server.

- ◆ [“Ports Console View” on page 998](#)

Ports Console View

This displays information about the serial ports such as COM ports and parallel ports such as LPT ports. The information about the ports includes:

- ◆ Port Name
- ◆ Controller
- ◆ Bus Type

Using the MIB Tools

Novell ZENworks[®] Server Management provides the tools to manage Simple Network Management Protocol (SNMP)-manageable devices on your network. This section describes the Management Information Base (MIB) tools, the SNMP MIB Compiler and the SNMP MIB Browser. It also explains how to set up and use the tools. See the following sections for more information:

- ♦ [Section 26.1, “Understanding MIB Tools,” on page 999](#)
- ♦ [Section 26.2, “Configuring MIBs and Setting Up MIB Tools,” on page 1008](#)
- ♦ [Section 26.3, “Using the MIB Browser,” on page 1011](#)
- ♦ [Section 26.4, “Maintaining MIBs,” on page 1020](#)

26.1 Understanding MIB Tools

The following sections provide information about the tasks required for managing SNMP devices using the MIB Compiler and the MIB Browser.

- ♦ [Section 26.1.1, “About MIBs,” on page 999](#)
- ♦ [Section 26.1.2, “Understanding the SNMP MIB Compiler,” on page 999](#)
- ♦ [Section 26.1.3, “Understanding the SNMP MIB Browser,” on page 1001](#)
- ♦ [Section 26.1.4, “Managing Devices with MIB Tools,” on page 1003](#)
- ♦ [Section 26.1.5, “Trap Definitions,” on page 1003](#)

26.1.1 About MIBs

To manage a device, you must obtain a copy of the MIB or MIBs that the device supports. A MIB is an ASCII text file, written in a precise format that describes the management information available on a particular class of devices. If, for example, you have an XYZ router from company X and you want to use Novell ZENworks Server Management for managing the router, company X must provide you with the XYZ router MIB. Novell ZENworks Server Management provides many standard and vendor-proprietary MIBs, which are found in the MIB Pool folder in the MIB Server Pool folder. By default, Novell ZENworks Server Management compiles the most generally applicable of these MIBs.

If you want to compile any new MIBs, you must store them in the MIB Pool folder in the MIB Server Pool folder. The console user can select or remove MIB files from the MIB Pool folder in the MIB Server Pool folder. The MIB Compiler compiles the files listed in the MIB Pool folder in the MIB Server Pool folder.

26.1.2 Understanding the SNMP MIB Compiler

The MIB Compiler does the following:

- ♦ Parses a set of predefined SNMP MIB files written in ASN.1 and SNMP V1, V2 syntax and verifies their syntax.

- ◆ Stores the compiled files in the Novell ZENworks Server Management database, which lets all users access these compiled files from a central location.

From the console, you can easily compile and maintain the MIB files located in the MIB Server Pool. You can add or remove MIB files from the MIB Pool.

- ◆ Updates trap definitions in the alarm template database.

The MIB Compiler lets you introduce new SNMP alarm templates into Novell ZENworks Server Management so they can be recognized and interpreted as alarms when they arrive at the console.

The Alarm Management System interprets the annotations to trap definitions in a MIB to set the severity level and device status assigned to an alarm. The MIB files included with Novell ZENworks Server Management are already properly annotated.

- ◆ The MIB Pool on the site server now includes RFCs, which are extensively used by third-party vendors.
- ◆ The MIB Pool now includes Novell proprietary MIBs like Novell GroupWise, Novell BorderManager, Novell eDirectory, Novell Gateways, and Novell VPN.
- ◆ The SNMP Compiler Results window now includes online help on the error codes generated during compilation. The help provides you all the troubleshooting information for the error codes, to enable you to solve the problems immediately.
- ◆ The SNMP Compiler Results window now highlights the error text in Red to enable better readability.
- ◆ The MIB Compiler now ignores minor errors in the MIB definitions. This enables the MIB Compiler to compile more MIBs.
- ◆ The type, category, generator type (TCG) of any MIB need not be unique. The SNMP MIB Compiler now captures all the traps for which the TCGs are identical.
- ◆ The SNMP MIB Compiler now works with the Alarm Management System to maintain the alarm information in synchronization with the available trap information in the MIB Pool. The SNMP MIB Compiler is now faster.

Figure 26-1 demonstrates how the MIB Compiler incorporates information from the MIB files into the Novell ZENworks Server Management database:

Figure 26-1 MIB file information incorporated into the Server Management database

During installation of Novell ZENworks Server Management, the MIB files that are precompiled using the MIB Compiler are also installed. The MIB for any SNMP node you want to manage must be compiled with Novell ZENworks Server Management. You can also integrate third-party MIBs. If you obtain a MIB file from a third-party vendor or any MIB file that was not installed with Novell ZENworks Server Management, you must compile the file using the MIB Compiler.

Using Role-Based Services with the MIB Compiler

Novell ZENworks Server Management role-based services let you assign various roles to users on your network. If your role is assigned the Enable MIB Compiler task, you can use the MIB Compiler.

See [Section 21.3, “Role-Based Administration,” on page 834](#) for more information about the role-based administration provided by Novell ZENworks Server Management.

26.1.3 Understanding the SNMP MIB Browser

The MIB Browser lets you manage SNMP-instrumented devices on the network.

To use this tool, you must have knowledge of SNMP and a good understanding of the structure of MIBs. Using the MIB Browser, you can manage nodes on the network by setting values of the MIB objects at the target nodes.

If you are familiar with the structure of an SNMP MIB, you can use the MIB Browser to retrieve data from SNMP-manageable node.

The MIB Browser lets you communicate with devices through an SNMP agent on the network over the User Datagram Protocol (UDP) or the Internet Protocol (IP). The results of SNMP commands are displayed in the MIB Browser window.

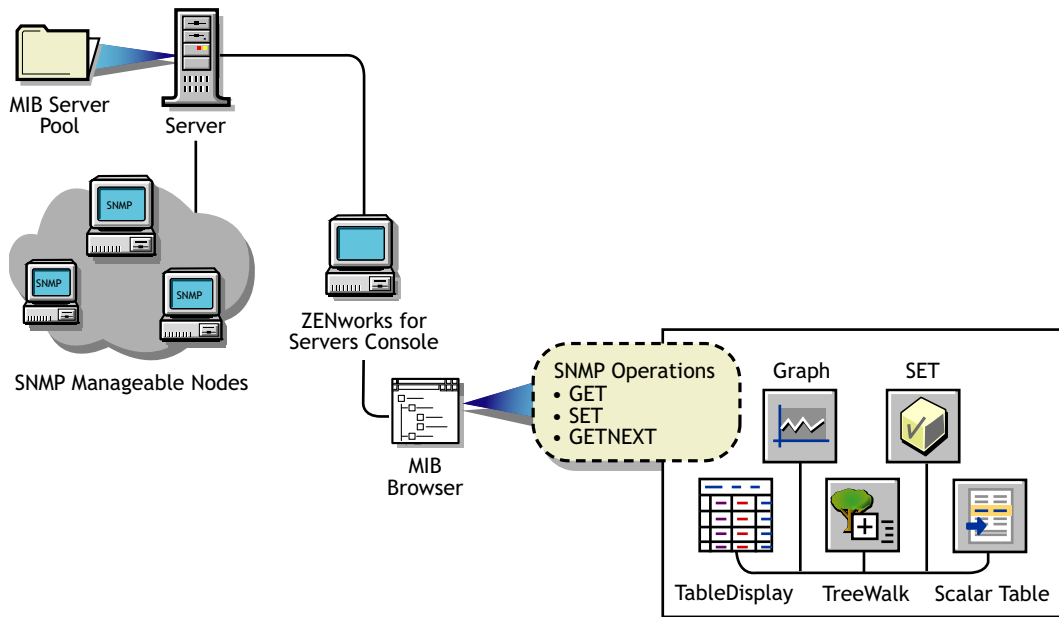

An SNMP agent is a program that provides access to management data about a particular network device and responds to SNMP Manager requests for the data. The NetWare[®] Management Agent software is an example of an SNMP agent that resides on a NetWare server. An SNMP agent resides in each manageable device on the network.

Although many Novell ZENworks Server Management windows display data retrieved from SNMP-manageable nodes, some administrators prefer the capability the MIB Browser provides for specifying the type of data they want to retrieve. Additionally, by using the MIB Browser, you can obtain some SNMP data that is not displayed in Novell ZENworks Server Management windows.

The MIB Browser takes the compiled MIB and displays the objects in a tree format. The MIB Browser also lets you walk the tree and look for the definitions of the selected MIB objects. You can set the community string to be used in the conversation between Novell ConsoleOne[®] and the SNMP-manageable node to manage the device.

[Figure 26-2](#) demonstrates the functionality of the MIB Browser:

Figure 26-2 MIB Browser functionality

The MIB Browser does the following:

- ◆ Represents the MIB information as a tree.

You can browse the objects in the MIB tree, which displays the composite OID (object identifier) for all compiled MIBs. The OID is the sequence of integers labeling each object on the path from the root of the tree to every object on the branches. The OID also describes the location of the object in the tree. For example, the novell(23) object in the tree is described as 1.3.6.1.4.1.23. For more information on the MIB tree, see [“Browsing the MIB Tree” on page 1011](#).

- ◆ Retrieves specific information about the node using the SNMP GET and GETNEXT commands.

The MIB information is displayed as:

- ◆ A table display for tabular objects

You can add new rows to the table and issue SNMP SET commands to update the columnar values of the table. For more information, see [“Modifying Instances of an SNMP Table” on page 1014](#).

- ◆ A graph display

If you choose to plot the SNMP requests, the Graph window displays the polled data of one or more MIB objects. For more information, see [“Graphing SNMP Request Results” on page 1018](#).

- ◆ A scalar table display

You can form a scalar table by combining scalar objects. You can modify the scalar entries of the table. For more information, see [“Forming Tables of Scalar Objects” on page 1017](#).

- ◆ A TreeWalk display

You can browse the OID values of scalar and tabular objects. For more information, see [“Viewing the Values of an Object and Its Child Nodes” on page 1013](#).

- ◆ Changes the information at the target node using the SNMP SET command.
You can retrieve or change the value of MIB objects if the community strings match at the target node. The node should also allow remote setting of its variables.
- ◆ Creates a profile by saving the properties of the table, scalar table, or graph.
You open the profile to view a table, scalar table, or graph of different SNMP-manageable nodes on the segment with the properties specified in the profile. For more information, see [“Using a Profile for Tables and Graphs” on page 1020](#).
- ◆ New icons for better readability including Scalar Objects, Table and the Table Entry Objects, Columnar Objects, and the MAXACCESS value.
- ◆ The Search utility now enables you to locate MIB variables in the MIB tree. You can locate them based on the MIB variable or the MIB OID.

For more information on the MIB Browser, see [Section 26.3, “Using the MIB Browser,” on page 1011](#).

Using Role-Based Services with the MIB Browser

Novell ZENworks Server Management role-based services let you assign various roles to users on your network. If your role is assigned the Enable MIB Browser task, you can use the MIB Browser.

See [Section 21.3, “Role-Based Administration,” on page 834](#) for more information about the role-based administration provided by Novell ZENworks Server Management.

26.1.4 Managing Devices with MIB Tools

Novell ZENworks Server Management lets you manage any SNMP-manageable devices on the network. In particular, you can do the following:

- ◆ Set alarm templates for receiving alarms, often referred to as SNMP traps, for these devices
- ◆ Use the MIB Browser to display and set values on these devices

Before using the MIB Browser to manage the devices, you need to perform the following tasks:

1. Acquire the necessary MIBs.
2. Add trap annotations, if required.
3. Add or remove MIBs using the [MIB Compiler](#).
4. Run the MIB Compiler to compile the MIBs in Novell ZENworks Server Management.

ASN.1 and SNMP V2 Support

The MIB Compiler supports all MIB files written in ASN.1 and SNMP V1, V2 syntax. The MIB Compiler allows relaxation of ASN.1 syntax.

26.1.5 Trap Definitions

Some SNMP MIBs define the traps that a device can send to Novell ConsoleOne when an unusual event occurs on the network. When you compile a MIB containing traps, information about those traps is added to the Novell ZENworks Server Management alarm database. When Novell

ZENworks Server Management receives a trap, the information in the alarm database is retrieved and used by Novell ZENworks Server Management to generate the alarm summary string and to determine the alarm type, alarm severity, state of the affected device, and other details.

You can improve the presentation of the alarm information in Novell ZENworks Server Management by adding annotations to the trap definitions in the MIB files. These annotations are added as comments to the trap definitions so that the MIB compiles with third-party MIB compilers.

All Novell® MIBs are annotated. If you choose not to annotate the traps in other MIBs, Novell ZENworks Server Management displays the alarms; however, they are less readable. SNMP MIBs use the TRAP-TYPE macro to define traps.

This section covers the following topics:

- ◆ “Keywords for Trap Definitions” on page 1004
- ◆ “Template Database” on page 1005
- ◆ “Keywords for Trap Annotations” on page 1005
- ◆ “Example Trap Definitions” on page 1006
- ◆ “Displaying Annotated Traps in Novell ZENworks Server Management” on page 1007
- ◆ “Formatting the SUMMARY String” on page 1007

Keywords for Trap Definitions

Table 26-1 explains a trap definition:

Table 26-1 *Keywords for Trap Definitions*

Keyword	Example	Explanation
TRAP-TYPE	duplpxNetAddr	Specifies the name of the trap. For example, duplpxNetAddr represents a duplicated IPX network address.
ENTERPRISE	Novell NetWare-GA-alert-mib	Contains the OBJECT identifier of a node in the vendor's tree, which, together with the trap number (the 8 following the ::= in DESCRIPTION) uniquely identifies the trap.
VARIABLES	(osName, osLoc, tiTrapTime, tiEventValue, tiEventSeverity, tiServer)	Defines an ordered sequence of MIB objects that are passed as parameters of the trap to provide additional information about the event. For example, osName is a text string specifying the name of the server sending the trap; osLOC is a text string specifying the location of the server; tiTrapTime is an integer specifying the time the event occurred.
DESCRIPTION	"Two servers use the same IPX Internet address."	Provides a textual description of the semantics of the trap.
Trap_number	::=8	Defines the trap.

Template Database

The MIB Compiler populates the alarm template database with the trap definitions in the MIB files. Any traps from the agents are stored in the database.

Keywords for Trap Annotations

Figure 26-2 lists and explains the keywords you can use to annotate traps:

Table 26-2 *Keywords for Trap Annotations*

Keyword	Explanation
--#TYPE	Short name for the alarm. The name can contain a maximum of 40 characters. If this annotation is not present, the SNMP trap name is used. Every trap should have a unique type.
--#SUMMARY	Description of the alarm with placeholders and formatting information for the actual parameters passed with the alarm. See "Formatting the SUMMARY String" on page 1007 for more information. Without this annotation, the alarm summary string lists each SNMP parameter name followed by its value.
--#ARGUMENTS	List of parameters to substitute in the SUMMARY string. Parameters are substituted in the order in which they appear in the list. Each element of the list is the index (zero-based) of the parameter in the VARIABLES clause.
--#SEVERITY	Default severity assigned to the trap. This can be one of the following: <ul style="list-style-type: none"> ◆ INFORMATIONAL ◆ MINOR ◆ MAJOR ◆ CRITICAL ◆ UNKNOWN Without this annotation, the severity is displayed as UNKNOWN.
--#TIMEINDEX	Index of the variable in the VARIABLES clause. This index contains the time when the alarm was generated. The time is expected to be an integer representing the number of seconds since 1970 (UNIX* time). If such a variable does not exist in the VARIABLES clause, use an index greater than the total number of variables in the VARIABLE clause.
--#HELP	This index contains name of the help file.
--#HELPTAG	The index contains the reference to the Help ID of the help file that is specified in the HELP index.

Keyword	Explanation
--#STATE	<p>Default state of the object when the alarm was generated. This can be one of the following:</p> <ul style="list-style-type: none"> ◆ OPERATIONAL ◆ NONOPERATIONAL ◆ DEGRADED ◆ UNKNOWN <p>Without this annotation, the state is UNKNOWN.</p>

Note the following rules about adding trap annotations:

- ◆ Each annotation must be embedded in a comment. Everything from the double hyphen to the end of the line is treated as a comment.
- ◆ Each annotation must be on a separate line.
- ◆ Annotations must appear in the order in which they are discussed in [“Trap Definitions” on page 1003](#).
- ◆ All annotations must be inserted after the DESCRIPTION clause and before the ::= clause.
- ◆ STATE and SEVERITY values are written to the alarm database the first time the MIB is compiled. If you want to modify the STATE and SEVERITY values for the alarm templates, modify these values in the corresponding MIB files and recompile using the MIB compiler.

Example Trap Definitions

The following sections explain a trap description in an SNMP trap before and after annotation:

- ◆ [“Example Trap Definition Before Annotation” on page 1006](#)
- ◆ [“Example Trap Definition After Annotation” on page 1006](#)

Example Trap Definition Before Annotation

```
dupIPXNetAddr TRAP-TYPE
ENTERPRISE Novell NetWare-GA-alert-mib
VARIABLES{osName, osLoc, tiTrapTime, tiEventValue, tiEventSeverity, tiServer}
DESCRIPTION "Two servers use the same IPX internetwork address."
::=8
```

Example Trap Definition After Annotation

```
dupIPXNetAddr TRAP-TYPE
ENTERPRISE Novell NetWare-GA-alert-mib
VARIABLES{osName, osLoc, tiTrapTime, tiEventValue, tiEventSeverity, tiServer}
DESCRIPTION "Two servers use the same IPX internetwork address."
```

-- Trap annotations are as follows:

```

--#TYPE "Duplicate IPX address"
--#SUMMARY "%s at %s and %s are using the same IPX address"
--#ARGUMENTS {0,1,5}
--#SEVERITY CRITICAL
--#TIMEINDEX 2
--#HELP "MYHELP.HLP"
--#HELPTAG 60004
--#STATE DEGRADED

::=8

```

Displaying Annotated Traps in Novell ZENworks Server Management

Assume that the dupIpxNetAddr trap shown in [“Keywords for Trap Definitions” on page 1004](#) was received by Novell ZENworks Server Management with the following variables:

- ◆ osName = SJM-JACK
- ◆ osLoc = JACK's CORNER
- ◆ tiTrapTime = ~700000000
- ◆ tiServer = SJM-TIM

To display a trap, use the Active Alarm, Alarm History, or Alarm Detail window. The following example shows the result:

Receive Time:03/04/99 09:15:45

Alarm Type: Duplicate IPX address

Summary: SJM-JACK at JACK's Corner and SJM-TIM are using the same IPX address

Severity: Severe

State: Degraded

Formatting the SUMMARY String

The SUMMARY keyword in the trap annotation lets you provide the actual wording of the alarm summary. This wording is used by Novell ZENworks Server Management when the alarm occurs.

Placeholders within the string are replaced by actual parameters of the trap before the string is displayed by Novell ZENworks Server Management. Each placeholder format string begins with a percentage sign (%) and tells Novell ZENworks Server Management how to format the parameter that will be substituted for the placeholder in the final string.

The placeholder format strings are substituted, in order, by the parameters specified in the ARGUMENTS keyword. The ARGUMENTS keyword lists the (zero-based) index of each trap parameter as specified in the VARIABLES clause. The indexes are listed in the order in which you want them to be substituted in the SUMMARY string.

Novell ZENworks Server Management can display a maximum of 140 characters in the SUMMARY string. Use the characters to display the most relevant information about the alarm. If you have a long SUMMARY string and want to keep the line length of the MIB file reasonable, you can insert multiple, consecutive SUMMARY annotations and the strings will be concatenated. For example, the following annotations below yield the same string:

```
–#SUMMARY “%s at %s and %s are using the same”
```

```
–#SUMMARY “IPX address”
```

```
–#SUMMARY “%s at %s”
```

```
–#SUMMARY “and %s are”
```

```
–#SUMMARY “using the same IPX address”
```

Table 26-3 lists the format strings and parameter types:

Table 26-3 *Format strings and parameter types*

Parameter Type	Format String	Printed Form
BOOLEAN	%s	True or False.
	%d	1 or 0.
INTEGER	%x	HEX.
	%d	DECIMAL.
	%t	Prints the integer or a date and time (Greenwich Mean Time). The integer represents seconds since 1970.
OCTET STRING	%s	Prints the text string with all control characters taken out.
	%m	Prints the first 6 bytes of data as a hyphen-separated MAC address. For example, 00-00-07-00-07.
	%x	Prints the octet string in hexadecimal. For example, 0000070007.
NULL	%d	Prints the number 0.
	%s	Prints the string NULL.
OBJECT IDENTIFIER	%s	Prints dot-separated decimal values. For example, 1.3.6.5.4.
IP Address	%s	Prints dot-separated IP address. For example, 13.56.56.56.
	%x	Prints a long hexadecimal value.
BIT STRING	%s	Prints each byte as decimal.

26.2 Configuring MIBs and Setting Up MIB Tools

This section describes the procedural tasks for configuring MIBs and setting up the community strings for SNMP operations on an individual node. After you complete these tasks, you can perform SNMP operations using MIB Tools.

This section covers the following topics:

- ♦ [Section 26.2.1, “Annotating Third-Party MIBs for Integration with Novell ZENworks Server Management,” on page 1009](#)
- ♦ [Section 26.2.2, “Compiling MIBs for SNMP-Manageable Nodes,” on page 1010](#)

26.2.1 Annotating Third-Party MIBs for Integration with Novell ZENworks Server Management

When you compile a MIB containing SNMP traps (alarms), information about those traps is added to the Novell ZENworks Server Management alarm database. This information can then be displayed in Novell ConsoleOne.

All Novell MIBs are annotated so that the alarm information displayed in Novell ConsoleOne is easily readable. This alarm information includes a summary describing the alarm, the alarm severity, and the state of the affected node. Third-party MIB files do not necessarily contain this same information. Therefore, the information about the traps in third-party MIBs is not as meaningful when displayed in Novell ConsoleOne.

You can add annotations to third-party MIB files for the trap definitions so that the alarm information displayed in Novell ZENworks Server Management for those traps is more readable than if you compile the MIB as is. Any annotations you add to a third-party MIB are added as comments to the trap definitions. This ensures that the MIB still compiles with third-party MIB compilers.

If you do not annotate the traps in third-party MIBs, Novell ZENworks Server Management will display the alarms. The MIB Compiler displays warnings in the status display about the missing annotations.

To add annotations to a third-party MIB:

- 1 Open the MIB in a text editor.
- 2 Add any of the annotations shown in [“Keywords for Trap Annotations” on page 1005](#), by following these rules:
 - ♦ Enter annotations only between the DESCRIPTION and the “:=” clause.
 - ♦ Each annotation must be on a separate line.
 - ♦ Annotations must be in the order shown in [“Keywords for Trap Annotations” on page 1005](#).
 - ♦ Embed each annotation as a comment. Precede each annotation with two hyphens and a pound sign (#).
For example: `--#Type "type_description"`
For a full example, see [“Example Trap Definitions” on page 1006](#).
- 3 When you finish annotating trap definitions, save your changes and exit the text file.
Compile the MIB, as described in [“Compiling MIBs for SNMP-Manageable Nodes” on page 1010](#).

Use Novell ConsoleOne Alarm Disposition table to view the values for the alarm severity level and alarm state from the default values in the SNMP MIBs. If you change the value for an alarm's severity or state after you compile the MIB, you must recompile the MIB for those changes to overwrite any changes made through the Alarm Disposition table.

26.2.2 Compiling MIBs for SNMP-Manageable Nodes

The MIB Compiler lets you manage the MIB Server Pool and also compile the .MIB files contained in the MIB Server Pool. The information in the compiled files is placed in the database on the Novell ZENworks Server Management server. The MIB Browser and the SNMP protocol decoder use this database.

The MIB Compiler also adds or updates any trap definitions to the alarm template database for use by the Novell ZENworks Server Management Alarm Management System.

The MIB Server Pool contains the list of MIB files. You can add or remove the MIB files from the MIB Server Pool.

To compile the MIBs:

1 In Novell ConsoleOne, click the Novell ZENworks Server Management server node.

2 Right-click the node then click *Properties*, and then click the *MIB Pool* tab.

The current MIB Pool lists the compiled MIB files present in the database.

3 Choose your options.

- ◆ To add MIBs, click *Add* to locate the .mib files and add them to the MIB Pool list.

The added MIBs are displayed in the adjacent list box.

When you add MIBs, you choose to integrate or exclude the trap information while compiling MIBs. If you do not integrate traps with the MIBs, only the MIB information is stored in the database on successful compilation of the MIBs. Click *Advanced*, then select the *Trap Integration* check box to integrate the trap information with the MIBs.

- ◆ To remove files from the MIB Pool list, select the MIB from the list, then click *Remove*.
- ◆ To compile the MIBs with less strict adherence to ASN.1 syntax, click *Advanced*, then select the *ASN.1 Syntax Relaxation* option.

4 Click *Compile*.

The MIB Compiler compiles all files in the MIB Pool list with the .MIB extension and updates the database. The compilation process is begun by launching a Results dialog box. This dialog box displays the status information of the MIBs including the MIBs that were successfully compiled, MIBs that were not compiled and the corresponding error message, and the status of updating the database with the MIB compile information, and the status of updating the Alarm database.

IMPORTANT: You cannot closed the Results dialog box during compilation. The *Close* button in the Results dialog box is disabled during compilation. You can close this dialog box only after the compilation is successful or failed.

5 Click *Close*.

IMPORTANT: If the SNMP MIB is not set up correctly, or an imported Request for Comments (RFC) is not available during compilation of the MIB, or any other `.mib` file is not available, an error message is generated in the MIB Compiler window. Add the required RFC or the dependent MIB and compile.

26.3 Using the MIB Browser

This section acquaints you with using the MIB Browser to manage SNMP-manageable nodes.

This section includes the following topics:

- ◆ [Section 26.3.1, “Browsing the MIB Tree,” on page 1011](#)
- ◆ [Section 26.3.2, “Viewing the Values of an Object and Its Child Nodes,” on page 1013](#)
- ◆ [Section 26.3.3, “Configuring a Node by Setting Object Values,” on page 1014](#)
- ◆ [Section 26.3.4, “Modifying SNMP Preferences,” on page 1014](#)
- ◆ [Section 26.3.5, “Modifying Instances of an SNMP Table,” on page 1014](#)
- ◆ [Section 26.3.6, “Forming Tables of Scalar Objects,” on page 1017](#)
- ◆ [Section 26.3.7, “Graphing SNMP Request Results,” on page 1018](#)
- ◆ [Section 26.3.8, “Using a Profile for Tables and Graphs,” on page 1020](#)

26.3.1 Browsing the MIB Tree

The MIB Browser lets you select the objects you want to display, and it sends SNMP queries to the node to obtain the data objects that you requested. It also allows SNMP operations such as GET, GETNEXT, and SET requests on a particular object in the MIB of an SNMP-managed node.

The MIB Browser periodically polls the node and continually updates the display. You can view and modify scalar and tabular data objects.

MIB Tree Browser

Within the MIB browser, the MIB Tree Browser is a graphical display of management data that consists of numerous objects.

The MIB Browser displays a composite OID tree for all compiled MIBs. Analogous to a file system, the MIB Browser shows leaf objects, which are the SNMP data objects.

The MIB Browser spans the selected node with its subtree and leaf objects and displays the name of the objects in the MIB Tree Browser. You browse from the highest level of the tree and view the leaf object values.

The top pane of the MIB Tree Browser displays the tree with the selected object. Each object is displayed as a file folder icon, followed by its SNMP name with the SubId appended in parentheses. If the object is a non-leaf node, the MIB Tree Browser also displays its children.

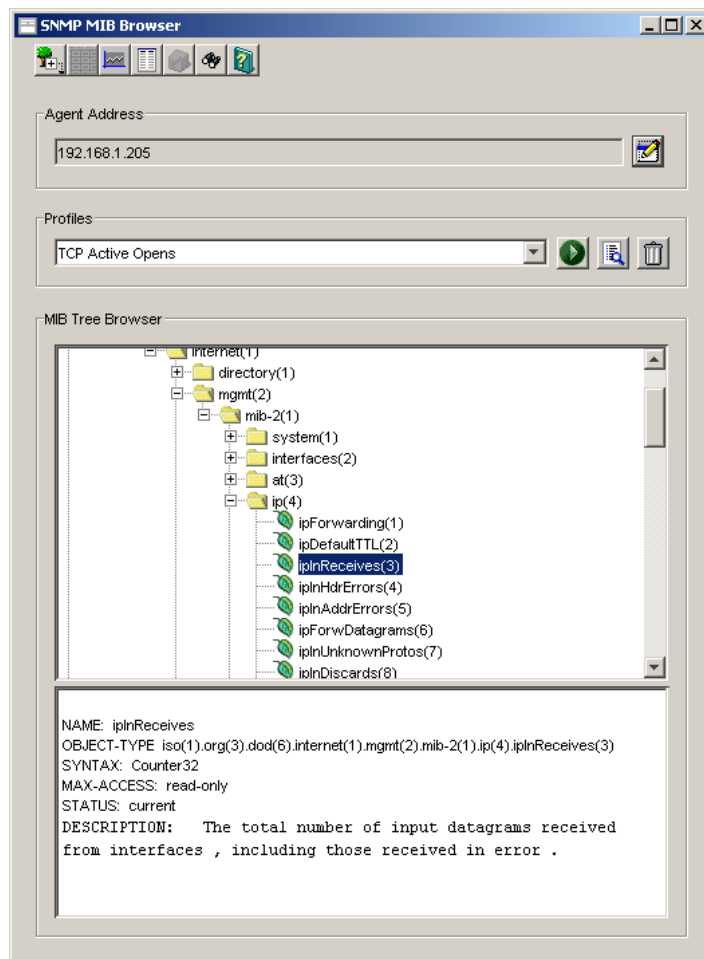

The bottom pane describes the selected object. The description is derived from the compiled MIB file. The format of the description is as follows: textual description of the object, full numeric OID and object name, ASN.1 type, size, textual convention, access, Index clause taken from the Entry object, status, and description.

For example, for an internal node SYSTEM with child nodes, the child nodes describe the properties of the SYSTEM. The OID of SYSTEM is iso(1).org(3).dod(6).internet(1).mgmt(2).mib-2(1).system(1). Another equivalent representation of this OID is 1.3.6.1.2.1.1. Note that the parent node does not have information, and the child nodes contain the properties.

The child nodes of SYSTEM are sysDescr OID(1.3.6.1.2.1.1.1), sysObjectID OID(1.3.6.1.2.1.1.2), sysUpTime OID(1.3.6.1.2.1.1.3), sysContact OID(1.3.6.1.2.1.1.4), sysName OID(1.3.6.1.2.1.1.5), sysLocation OID(1.3.6.1.2.1.1.6), and sysServices OID(1.3.6.1.2.1.1.7).

Figure 26-3 shows the MIB Browser window:

Figure 26-3 SNMP MIB Browser

To browse the MIB objects:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > MIB Browser*.
- 3 Click the object whose values you want to view from the MIB Tree Browser.
 - ♦ To select an object, click the name text or the icon in the MIB Browser tree.
 - ♦ To expand or collapse the next level in the tree display, double-click the object.

26.3.2 Viewing the Values of an Object and Its Child Nodes

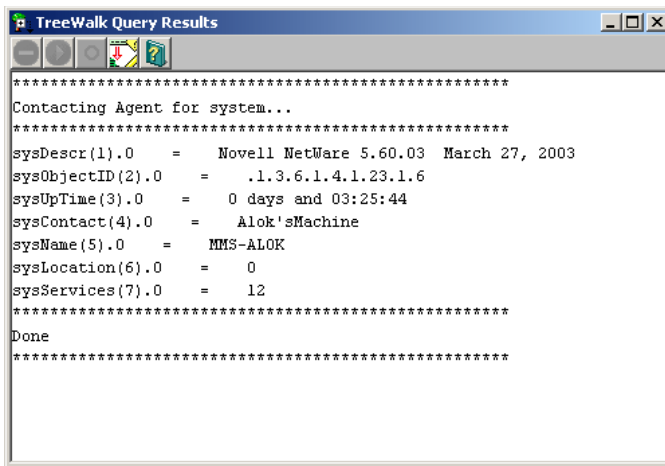

The MIB Browser spans the selected node with its subtree and leaf objects and displays its values in the TreeWalk Query Results window. You can browse the OID values of scalar and tabular objects.

To view the values of the instances of a MIB object:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > MIB Browser*.
- 3 Click the object, then *Perform TreeWalk* for the node button.

Figure 26-4 shows the TreeWalk Query Results window:

Figure 26-4 TreeWalk Query results

If you select a leaf object, you can view the values for each instance of this object. For non-leaf objects, this window will display all the values of the child node of this object. For example, if you want to view the values of the child nodes for the object *system*, click the parent object *system*.

The display process in the Treewalk Query Results window continues recursively for all the non-leaf objects of the selected object. You can pause and resume this display in the window.

Customizing the Display of TreeWalk Query Results Window

The TreeWalk Query Results window displays the number of lines based on the settings specified in the `treewalk.properties` file.

This file, located in `\novell consoleone\version\bin\saved-views\generic` directory, contains the following setting:

```
MaximumNumberOfLine=number_of_lines_for_display
```

where *number_of_lines_for_display* is the number of lines that will be displayed at a time. The default setting is 10,000 lines. You can modify this setting. The settings will apply only if you restart Novell ConsoleOne and bring up the TreeWalk Query Results window. To clear the display in the TreeWalk Query Results window when the text buffer is full, click the *Clear* button. There may be some out of memory problems if you specify a large line setting in the `treewalk.properties` file.

26.3.3 Configuring a Node by Setting Object Values

Using the MIB Browser, you can issue an SNMP SET command to change information at an SNMP-manageable node if you have the appropriate privileges. You select a scalar object from the MIB Browser and set its value.

You can modify the values for an integer, enumerated integer, object identifier, string, and IP address object types.

To issue an SNMP SET command for a scalar object:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > MIB Browser*.
- 3 Click a scalar object whose values you want to view, then click *Display Data As a Scalar Table*.
- 4 Specify the object value for the scalar object.
- 5 Click *OK*.

To modify columnar values of an SNMP table, see [“Modifying Instances of an SNMP Table” on page 1014](#).

26.3.4 Modifying SNMP Preferences

SNMP parameters are used to communicate with the target device. The MIB Browser lets you change the SNMP community strings or specify the transport address of a new target device.

Any SNMP operation requires these values to be set. After starting an SNMP operation, such as polling a table, changing the SNMP preferences does not affect the operation.

You can modify the following parameters:

- ♦ **Agent Address:** You can specify the IP or internal IPX address and the Domain Name System (DNS) name of the SNMP-manageable node to which you want to send an SNMP request. This node should have an SNMP agent.
- ♦ **SET and GET Community Strings:** The community string that Novell ZENworks Server Management uses must match the one expected by the SNMP agent in the managed node or the SNMP operations will fail. If the SNMP agent on the node expects a community string for SET and GET operations that is different from public (the default), you can specify the expected community string to override the default community or those community strings you set previously. You can use Unicode* or International characters for the community string.

To modify the SNMP preferences:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > SNMP MIB Browser*.
- 3 Click *Modify SNMP Preferences*.
- 4 Specify the parameters, then click *Close*.

26.3.5 Modifying Instances of an SNMP Table

A table in an SNMP MIB is an SNMP construct derived from the structure of the MIB. Each row in the table corresponds to a row in the SNMP table.

The MIB Browser provides the Table Display window to display tabular objects you select. This window displays one or more rows from an SNMP table in a two-dimensional grid and follows the SNMP index order to display rows.

The table shows each column in the SNMP table as columns. Each column heading is derived from the SNMP table columns. The Table Display window displays the columns with their values as single or multiple rows for the MIB you selected.

SNMP allows operations on individual table entries only. The OID identifies the column and row.

From the MIB Browser, you can perform the following operations:

- ◆ Add rows to an SNMP table
For more information, see [“Adding Rows to an SNMP Table” on page 1016](#).
- ◆ Modify a row of an editable table
For more information about adding or modifying rows, see [“Adding Rows to an SNMP Table” on page 1016](#).
- ◆ Save the table as a profile
For more information about saving a table as a profile, see [“Using a Profile for Tables and Graphs” on page 1020](#).

Viewing the SNMP Table

To view the SNMP table:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > SNMP MIB Browser*.
- 3 Click a tabular object whose values you want to view, then *Display Data As a Table*.

From the Table Display window, you can add rows or modify the rows of the SNMP table and input values for each column. For more information about adding or modifying rows of an SNMP table, see [“Adding Rows to an SNMP Table” on page 1016](#).

[Figure 26-5](#) shows the MIB Browser Table Display window.

Figure 26-5 MIB Browser table

hostTopNReport	hostTopNIndex	hostTopNAddress	hostTopNRate
6,300	1	FF FF FF FF FF FF	497
6,300	2	00 90 21 5A BC 27	270
6,300	3	00 03 47 1F 3D 2F	219
6,300	4	01 80 C2 00 00 00	49
6,300	5	01 00 5E 00 01 16	29
6,300	6	01 00 5E 7F FF FD	26
6,300	7	01 00 81 00 01 00	10
6,300	8	01 00 81 00 01 01	10
6,300	9	01 00 1D 00 00 00	10
6,300	10	03 00 00 00 00 01	6
6,300	11	00 B0 D0 22 C3 72	4
6,300	12	00 00 1D 29 19 FF	1
6,300	13	00 08 C7 C9 88 C2	1
6,300	14	01 00 0C CC CC CC	1
6,300	15	00 C0 4F 37 C6 93	1
6,300	16	00 E0 2B 00 00 00	1
6,300	17	00 0F 20 33 46 59	1
6,300	18	00 01 03 21 A7 8D	0
6,300	19	00 0B CD 10 C5 86	0
6,300	20	08 00 20 9A 0E 5E	0

The MIB Browser periodically sends SNMP queries to the node to obtain the data objects you request. When you provide new values for writable objects, the MIB Browser writes these values to the node. The MIB Browser periodically polls the node and continually updates the display. You can change the polling interval by suspending the SNMP interaction or by canceling the SNMP interaction.

Adding Rows to an SNMP Table

When you add a new row to an SNMP Table, the MIB Browser generates the SNMP SET request.

Before generating the SNMP Set request, the MIB Browser sends a GET command to the node that you selected in the MIB Browser table and retrieves the value of the object. On adding rows with the specified values for the objects, the MIB Browser issues multiple SNMP SET commands to update the SNMP table.

To add a row to an SNMP table:

- 1 Click the table object from the MIB Browser window, then *Add a New Row to the Table*.

For more information about selecting the table object, see [“Modifying Instances of an SNMP Table” on page 1014](#).

The following figure shows the Add Row to Table window:

- 2 Double-click the row.
- 3 Modify the value then click *OK*, and then click *OK*.

To add rows in an SNMP table, you must input the values for all the index rows, which are denoted by asterisks.

To modify a row of an editable table:

- 1 Open the Table window.
- 2 Click the row whose values you want to modify, then click *Issue SNMP Set request for a column* button.
- 3 Double-click the row.
- 4 Modify the value of the object then click *OK*, and then click *OK*.

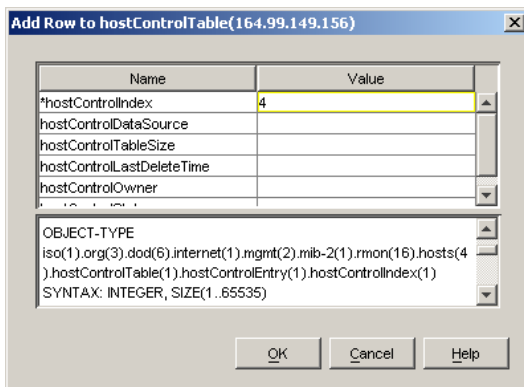

26.3.6 Forming Tables of Scalar Objects

You can make a scalar table by combining the scalar objects from the MIB Browser. A scalar table is a two-column table with the name and value of the scalar object entries. To create a scalar table, you select a group node with scalar child nodes or a group of scalar objects. For example, you add one or more scalar objects such as ipInDelivers and SysUpTime to make a new scalar table labeled ipInDeliversTable.

If you want to view the scalar tables that you create, save the scalar table as a profile. You can load the scalar table profiles when required.

Figure 26-6 shows the Scalar Table window:

Figure 26-6 Scalar Table

To combine scalar objects as a scalar table and view the table:

- 1 Create a new scalar table.
- 2 Add to or modify the existing table by adding scalar entries or by removing entries from the table.
- 3 Save the scalar table as a profile.
- 4 Launch the profile.

To create a new scalar table:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Click *File > Action > SNMP MIB Browser*.
- 3 Right-click a scalar group or a scalar object then click *New*, and then click *Scalar Table*.

To add or remove scalar entries to an existing table:

- 1 Open an existing scalar table.
- 2 Toggle to the MIB Browser window then click *Add to*, and then click *Scalar_table_name*.
Alternatively, click the scalar entry in the MIB Browser window, and from the Scalar Table window, click *Add Node Selected* from Browser Window.

To remove the scalar entry, click the scalar entry in the Scalar Table window, and click *Remove the Node Selected in This Window*.

26.3.7 Graphing SNMP Request Results

You can plot the SNMP request results in a graph that displays the polled data of the MIB objects. Only attributes of ASN.1 type Integer, Counter, Time Ticker, and Unsigned Integer are plotted as current absolute values.

You can plot more than one object in the same graph, add more objects, or remove the MIB objects from the existing graph. If you want to view the graphs that you create, save the graph as a profile. You can then load the graph profiles when required.

To graph SNMP request results of one or more nodes:

- 1 Click the target SNMP-manageable node from the console.
- 2 Click *File > Action > SNMP MIB Browser*.
- 3 Click the MIB object whose values you want to plot.
- 4 Right-click the object then click *New*, and then click *Graph*.

The MIB Browser plots the graph with the values of the selected object and its leaf object values dynamically in the Graph pane of the window.

Figure 26-7 shows the Graph window:

Figure 26-7 Graph window

To graphically plot the values of more than one object:

- 1 Toggle to the MIB Browser window.
- 2 Click the MIB object you want to plot then click *Add To*, and then click the *Graph*.

You add these objects to any of the active graph windows you want.

Alternatively, you can click the MIB object from the MIB Browser window and then click the *Add* button in the MIB Browser Graph. Remove the objects from the list that you do not want by selecting the node from the list and clicking the *Delete* button.

From the Graph window, you can perform the following operations:

- ◆ Rescale the Y-axis of the graph
- ◆ Set the period to display
- ◆ Set the polling interval and refresh rate of the display

By default, the values plotted in the graph are absolute. If you want to view the rate of change of values per second with respect to sysUpTime, you must click the *Rate* option. For example, if you click *ipInPackets* and choose the *Rate* option, you can view the values per second.

26.3.8 Using a Profile for Tables and Graphs

A profile contains information about the properties of the graph, table, or scalar table. You use a profile to specify the information, such as the method of display (table or graph) and polling interval.

You create a profile by saving the properties of the table, scalar table, or graph as a profile. You open the profile to view a table, scalar table, or graph of different SNMP-manageable nodes on the segment with the same properties specified in the profile. You can modify or delete the profile.

To form a profile:

- 1 Save the properties of the display window.
- 2 Open the profile.
- 3 Modify the properties of the profile as required.

To save a profile:

- 1 Click the *Save* button from the Scalar table window, Graph window, or Table window.
- 2 Enter the details of the profile.
Specify the name, description, and properties of the objects.
- 3 Click *OK*.

To open a profile:

- 1 From the MIB Browser window, click the profile you want from the drop-down list.
- 2 Click *Launch This Profile*.

To modify the selected profile:

- 1 Click *View/Edit Profile Contents* for the selected profile in the MIB Browser window.

To delete a selected profile:

- 1 Click *Delete This Profile*.

26.4 Maintaining MIBs

Depending on your need to add MIBs for managing nodes, you must compile the MIBs.

To delete a particular MIB from Novell ZENworks Server Management, remove the appropriate MIB text file from the MIB Server Pool and rerun the MIB Compiler. If the MIB you delete contains traps, you must remove the alarm definitions before you rerun the MIB Compiler.

When you add MIBs, you choose to integrate or exclude the trap information while compiling MIBs. If you disallow trap integration with the MIBs, only the MIB information is stored in the database on successful compilation of the MIBs.

For more information about how to add or remove MIBs, refer to [“Compiling MIBs for SNMP-Manageable Nodes” on page 1010](#).

Using the Probe Manageability Tool

The Probe Manageability tool helps you find the MIBs implemented on a node or a set of nodes either at the Atlas or the Custom Atlas level.

The following sections provide detail information about how to access and work with the Probe Manageability tool:

- ♦ [Section 27.1, “Invoking the Probe Manageability Tool,” on page 1021](#)
- ♦ [Section 27.2, “Working with the Probe Manageability Tool,” on page 1022](#)

27.1 Invoking the Probe Manageability Tool

You can invoke the Probe Manageability tool in one of the following ways:

- ♦ In ConsoleOne, right-click the Atlas or the Custom Atlas object, click Actions, then click Probe Manageability.
- ♦ In ConsoleOne, select the Atlas or the Custom Atlas object, click the File Menu, click Actions, then click Probe Manageability.

The Probe Manageability window is displayed:

Figure 27-1 Probe Manageability Window

If the Probe Manageability tool is launched from a node level, the List of Nodes pane displays DNS name, IP address, or the Novell eDirectory name of the selected node. It also displays the status of the Probe Manageability operation. The status could be one of the following:

- ♦ **Not Started:** Indicates that the Probe Manageability operation has not yet been performed on the node.
- ♦ **Completed:** Indicates that the Probe Manageability operation has been successfully completed. If Probe Manageability is successful for a single node, then the list of implemented MIBs in it is shown in the Probe Manageability Log pane.
- ♦ **Failed:** Indicates that the Probe Manageability operation has not been successfully completed.

Possible Causes:

(1) SNMP communication failure: The Probe Manageability Log pane displays the SNMP parameters for the node.

(2) Unable to find the node details in the database: The Probe Manageability Log pane displays the node not found in the database message. The complete messages are logged in the file `Novell_ConsoleOne_Directory\1.2\bin\Probe.log`.

This log file contains the list of implemented and unimplemented MIBs and their OIDs for the nodes. It also contains the reason for failure in case probe manageability fails for a node.

27.2 Working with the Probe Manageability Tool

Review the following sections to understand how to work with the Probe Manageability tool:

- ♦ [Section 27.2.1, “Adding a Node to the List,” on page 1022](#)
- ♦ [Section 27.2.2, “Adding Multiple Nodes at a Time to the List,” on page 1022](#)
- ♦ [Section 27.2.3, “Deleting a Node from the List,” on page 1023](#)
- ♦ [Section 27.2.4, “Starting the Probe Manageability Operation,” on page 1023](#)
- ♦ [Section 27.2.5, “Stopping the Probe Manageability Operation,” on page 1023](#)
- ♦ [Section 27.2.6, “Viewing the Probe Manageability Log for a Node,” on page 1023](#)

27.2.1 Adding a Node to the List

- 1 In the Probe Manageability window, click  located in the List of Nodes pane.
- 2 In the Add a Node window, type the eDirectory name, the DNS name or the IP address of the node. You can also click to browse to and select a node.
- 3 Click Add.

The node is added to the list of nodes.

27.2.2 Adding Multiple Nodes at a Time to the List

- 1 In the Probe Manageability window, click  located in the List of Nodes pane
- 2 In the Select Objects window, select multiple nodes that you want to add to the list.
- 3 Click OK.

The selected nodes are added to the list of nodes.

27.2.3 Deleting a Node from the List

- 1 In the Probe Manageability window, select the node you want delete from the list of nodes
- 2 Click .

The selected node is deleted from from the list of nodes.

27.2.4 Starting the Probe Manageability Operation

- 1 In the Probe Manageability window, click Start.

27.2.5 Stopping the Probe Manageability Operation

- 1 In the Probe Manageability window, click Stop.

27.2.6 Viewing the Probe Manageability Log for a Node

- 1 Click View Log.

The log for nodes for which Probe Manageability is completed till that instance is shown in the Log pane. However, to view the information of a specific node, select the node in the List of Nodes pane. At the end of current Probe Manageability session, log for all the nodes is displayed in the Log pane.

The location of log file is `Novell_ConsoleOne_Directory\1.2\reporting\Probe_Manageability\Probe.log`:

Figure 27-2 Probe Manageability Log

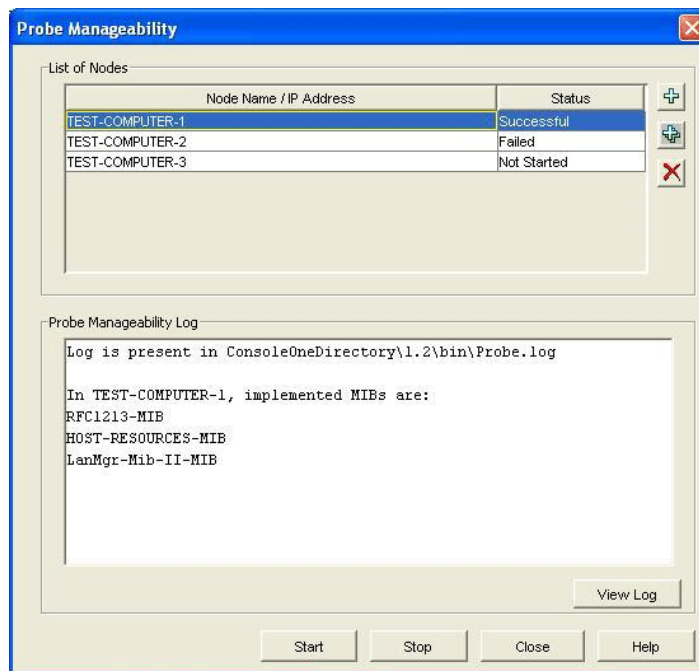

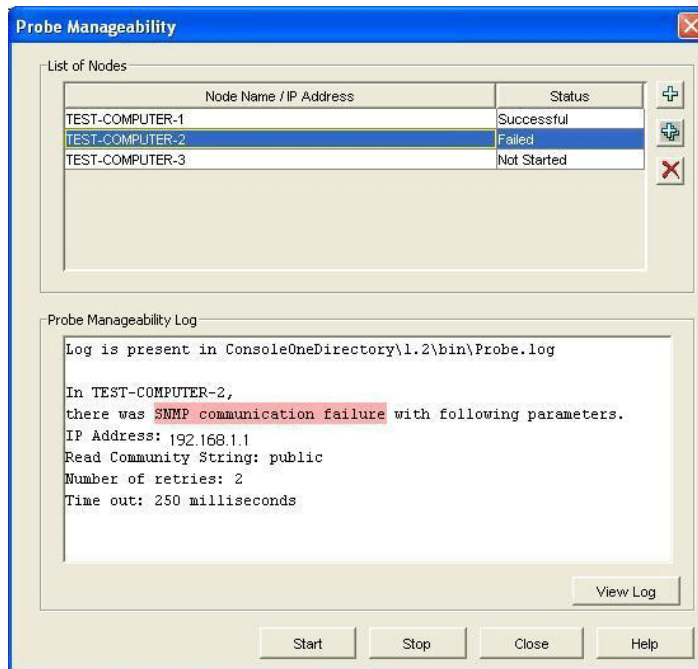

Figure 27-3 Probe Manageability Log with details of SNMP failure.

Monitoring Services

Novell ZENworks[®] Server Management lets you test the connectivity and availability of a service on a network device. This test checks and measures the response by sending diagnostic packets, and also notifies the console whenever the status of the service changes.

This section provides an overview of the testing facility, lists the services that can be monitored on the nodes, and discusses the test options. See the following sections for more information:

- ♦ [Section 28.1, “Understanding Monitoring Services,” on page 1025](#)
- ♦ [Section 28.2, “Monitoring Services on Target Nodes,” on page 1027](#)

28.1 Understanding Monitoring Services

Using the Monitoring Services facility, you test connectivity of services on one or more critical network devices, such as servers or routers. For example, you can monitor services because you want to be alerted immediately if the connectivity between the console and critical nodes is disrupted.

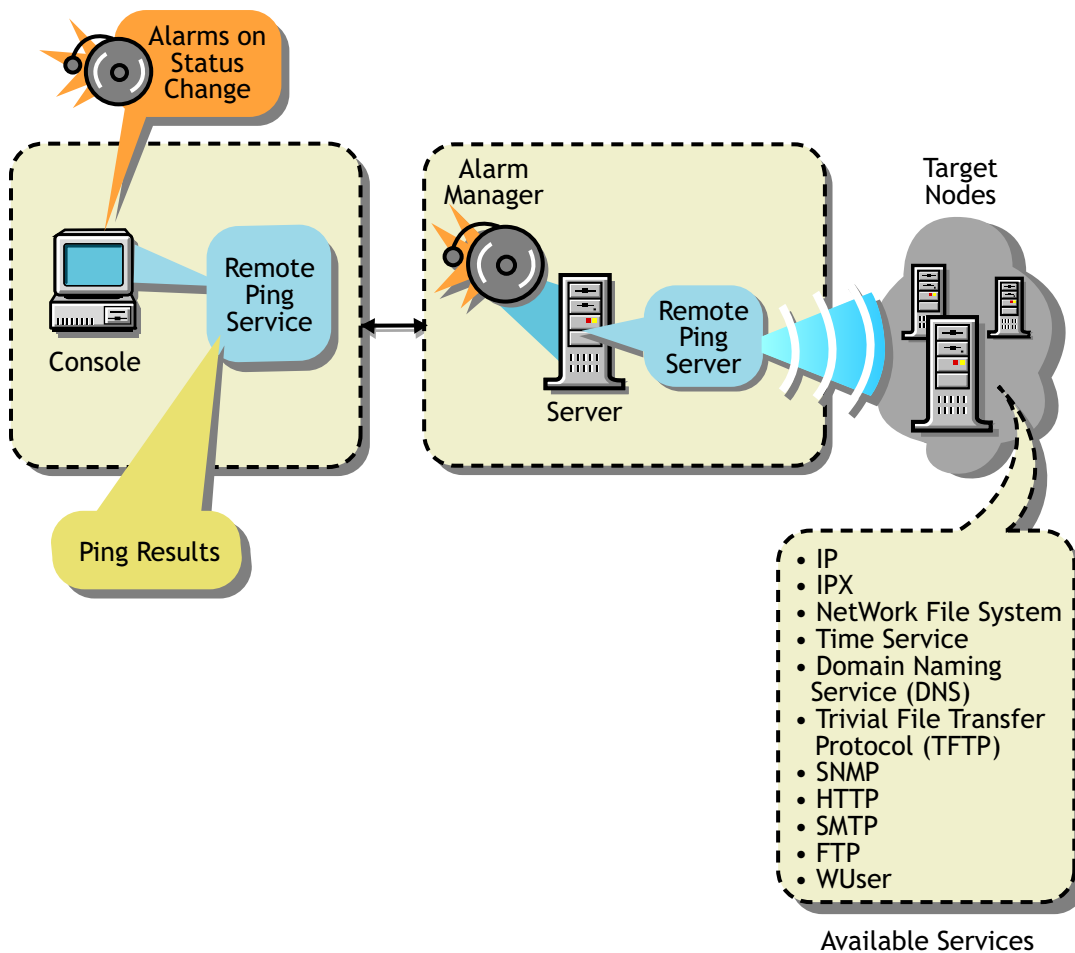

This test facility enables testing of the following services:

- ♦ Domain Name System (DNS)
- ♦ Dynamic Host Configuration Protocol (DHCP)
- ♦ Echo
- ♦ File Transfer Protocol (FTP)
- ♦ Hypertext Transfer Protocol (HTTP)
- ♦ Hypertext Transfer Protocol Secure (HTTPS)
- ♦ Internet Packet Exchange™ (IPX™)
- ♦ Internet Protocol (IP)
- ♦ Network File System (NFS)
- ♦ Network News Transfer Protocol (NNTP)
- ♦ Simple Mail Transfer Protocol (SMTP)
- ♦ Simple Network Management Protocol (SNMP)
- ♦ Time Service
- ♦ Trivial File Transfer Protocol (TFTP)
- ♦ WUser

The test facility uses the Novell ZENworks Server Management server as the remote ping server. When you select the service on the node for testing, the console interacts with the remote ping server on the Novell ZENworks Server Management server and displays the results of the test on the console.

[Figure 28-1](#) shows a graphical representation of Monitoring Services:

Figure 28-1 The Console, Remote Ping Server, and the target nodes

To monitor nodes, you choose the nodes and enable the monitoring session for the duration you require.

From the console, you monitor the services in the following ways:

- ◆ Test connectivity of the services on a node one time only when you suspect a problem with the connectivity.
- ◆ Continuously monitor connectivity of the services on a critical node until you close the test facility.
- ◆ Continuously poll the services of the nodes on the segment (for example, connectivity testing of the services on the target nodes runs uninterrupted until you disable monitoring). If you do not disable monitoring, this test facility continues even after you close the console.

For testing connectivity of services on the target nodes you select, you set the following options:

- ◆ Specify the services on the selected target nodes.
 - If you need to test any TCP-based services, add the service to the existing list of services.
- ◆ Define the test interval between two successive tests.

- ◆ Define the timeout value.

The timeout value determines the time duration that the remote ping server waits to receive the response from the target node.

You can view the status of the connectivity and measure diagnostics, such as round trip delays or number of packets sent and received from the console.

28.1.1 Role-Based Services for Using the Monitoring Services

Role-based services (Role-based Services) defines the task for Monitoring Services as Enable Remote Ping. If this task is assigned to your role, you can use the Monitoring Services facility.

For general information about role-based traffic analysis tasks, creating Role-based Services role objects or specifying tasks that Role-based Services roles can perform, see [Section 21.3, “Role-Based Administration,”](#) on page 834.

28.2 Monitoring Services on Target Nodes

This section guides you through the tasks involved in using the Monitoring Services facility.

From the console, you can monitor critical nodes on the network and manage potential connectivity problems before they affect the network. You define the services to test on the selected nodes, then view the test results and other data for each listed target. To perform the testing, complete the following general steps:

1. Define the targets to be monitored.

See [“Defining the Targets for Monitoring Services”](#) on page 1027 for information about specifying the services on the target nodes.

2. On a per-node basis or on multiple nodes, change the test interval or timeout value.

These tests use default values for the test interval between two successive tests on the target and to determine the time duration that the remote ping server waits to receive the response from the target node. You can change these values for the test.

See [“Changing the Test Options for a Node”](#) on page 1030 for information about editing the test options.

3. View the test results.

The nodes are monitored continuously, at the defined test interval for the node. Depending on the Monitoring Services test that you choose, the corresponding test results are displayed.

See [“Displaying Test Results Data”](#) on page 1029 for information about test results data.

28.2.1 Defining the Targets for Monitoring Services

Monitoring Services requires that you specify the targets for the tests. You can choose from the following test options:

- ◆ [“Test the Services on the Target Node One Time Only”](#) on page 1028
- ◆ [“Continuously Monitor the Services on the Target Nodes”](#) on page 1028
- ◆ [“Continuously Poll the Services of the Target Nodes on a Segment Until the Test Is Disabled”](#) on page 1028

NOTE: You can monitor approximately 50 critical services simultaneously on the servers. Monitoring more than 50 services may overload the server memory and result in performance degradation.

Test the Services on the Target Node One Time Only

If you suspect a problem with a node in the network, you can ping the node once for monitoring services. When you select the target node for testing the services and specify the IP or IPX address, this address will determine the service that will be tested at the node. For example, if you enter the IPX address, the default IPX service is tested on the target node.

The results of the test will display the status of the target node and details of the round trip delay in the Ping window.

To test the services on a node once:

- 1 In Novell ConsoleOne, right-click the selected node, then click *Ping*.
- 2 Enter the ping target details.
- 3 Click *OK*.

Continuously Monitor the Services on the Target Nodes

To specify the services for continuous monitoring, add the targets and choose the services on the node and other options. The target node will be added to the list of targets in the Connectivity Test Results window and the test results data will be displayed. Monitoring of services continues until you close this window.

To define the targets for testing services on the node:

- 1 In Novell ConsoleOne, click *Action*, then select *Connectivity Test*.
- 2 Click *Add*.
- 3 Specify the details for the target nodes in the Add Ping Target dialog box.
Refer to [“Adding Services for Monitoring” on page 1030](#) for more information about adding services.
- 4 Click *OK*.

The target node will be added to the list of targets in the Connectivity Test Results window.

Continuously Poll the Services of the Target Nodes on a Segment Until the Test Is Disabled

For polling the services on the nodes of a segment, select the nodes on a segment with the list of services you want to test. Enable the test in the Monitor Tab Services window and view the results of the test in the Polling view.

If you do not disable the test, polling of the services continues after you close the console.

To define the services on the nodes for polling:

- 1 In Novell ConsoleOne, right-click the node of a segment then click *Properties*, and then click the *Monitor Services* tab.

The List of Segment dialog box displays the different addresses of the same node on different segments if the node is connected to more than one segment. Click the node on the segment that you want to add.

- 2 Specify the details for the target nodes in the Monitor Services Tab window.

Refer to [“Adding Services for Monitoring” on page 1030](#) for more information about adding services.

- 3 Click *OK*.

28.2.2 Displaying Test Results Data

After defining the services for testing on the target node, you can view the results from the console.

Depending on the test you choose, the test results are displayed in the corresponding window.

If you choose to test the services on the node one time only, the test results will be displayed in the Ping Status window of the Ping window. This target will not be tested in the Connectivity Test Results window.

If you choose to continuously monitor the services, the test continues until you close the window. You can view the results in the Connectivity Test window.

If you choose to continuously poll the services until you disable the test, you can view the test results in the Polling view.

The following test data is available when you monitor the services on the target nodes:

Ping Target: Name or address (IP or IPX) of the network device for which services are being tested.

Service: Monitored services that are being tested on the target.

Port: Port number that the service uses.

Status of the Target: Up Status means that the service is available on the node and can be reached from the remote ping server. Down Status means that the service is down and cannot be reached from the server.

RoundTrip Delay: Time interval (in milliseconds) between the instant the remote ping server sends the test packet to the target and the instant the response is received from the target.

Packets Sent: Number of packets sent from the remote ping server to the target node.

Packets Received: Number of packets received by the remote ping server from the target node.

Packets Lost: Number and percentage of packets lost during the testing of the target node.

Interval: Displays the test interval value, in seconds. This value determines the time duration between two successive tests on the target.

Timeout: Displays the timeout value, in milliseconds. This value determines the time duration that the remote ping server waits to receive the response from the target node.

To view the Connectivity Test Results window:

- 1 Click *File > Action > Connectivity Test* from the Console.

If you select one or more target nodes from the right pane of the console, the list of nodes that you want to test for connectivity will be shown in the Connectivity Test Results window.

To view the results of the polling:

- 1 From the console, click a segment, then *View > Polling*. The result would also appear at the atlas level. Select any atlas, click *View > Polling*. You can use this option to view the status of all the nodes that you have added using the Monitor Services tab.

NOTE: To delete a target node from the list, from the Polling view, click the target node, then click *Delete*.

28.2.3 Changing the Test Options for a Node

You can modify the test options, such as the test interval and timeout options, that you set earlier on an individual node or on multiple nodes. To modify multiple nodes, click more than one node from the Connectivity Test Results window; the test options apply to all selected target nodes.

To view the Connectivity Test Results window:

- 1 Click the target row from the Connectivity Test Results window, then click the *Edit* button.
- 2 Enter values for the Ping Interval and Timeout.
- 3 Click *OK*.

If you want to roll back to the default setting, click *Apply Defaults*.

28.2.4 Adding Services for Monitoring

Monitoring Services lets you test services on the nodes. If you need to test any TCP-based service that is not listed in the default services list, you add the details of the service when you are adding the targets.

You specify the name of the service in the Add Service dialog box. Ensure that the service name you add is a unique name. Also, you must specify the port number for the service.

You can add the details of the service under the following circumstances:

- ♦ [“Continuously Monitor the Services on the Target Nodes” on page 1028](#)
- ♦ [“Continuously Poll the Services of the Target Nodes on a Segment Until the Test Is Disabled” on page 1028](#)

The services that you add are stored in a file on the server.

Understanding Traffic Analysis

Novell ZENworks[®] Server Management provides traffic analysis tools that monitor network traffic, capture data, and collect key statistics of monitored segments nodes, and devices, allowing you to obtain, review, and analyze vital information to effectively troubleshoot and manage your LAN and keep your network operating at peak performance.

This section contains the following topics:

- ♦ [Section 29.1, “Understanding Traffic Analysis,” on page 1031](#)
- ♦ [Section 29.2, “Planning for Segment Monitoring,” on page 1045](#)
- ♦ [Section 29.3, “Preparing to Analyze Network Traffic,” on page 1048](#)
- ♦ [Section 29.4, “Analyzing Network Traffic,” on page 1050](#)
- ♦ [Section 29.5, “Optimizing Traffic Analysis,” on page 1081](#)
- ♦ [Section 29.6, “Understanding the Traffic Analysis Agents,” on page 1092](#)
- ♦ [Section 29.7, “Using the Traffic Analysis Agent for NetWare,” on page 1094](#)
- ♦ [Section 29.8, “Using the Traffic Analysis Agent for Windows,” on page 1109](#)

29.1 Understanding Traffic Analysis

This section contains basic information to help you understand traffic analysis and describes the Novell ZENworks Server Management traffic analysis components.

- ♦ [Section 29.1.1, “Traffic Analysis Components,” on page 1031](#)
- ♦ [Section 29.1.2, “Communication Between Traffic Analysis Components,” on page 1032](#)
- ♦ [Section 29.1.3, “Traffic Analysis Features,” on page 1033](#)
- ♦ [Section 29.1.4, “Traffic Analysis Fundamentals,” on page 1034](#)

29.1.1 Traffic Analysis Components

The Novell ZENworks Server Management traffic analysis components include:

- ♦ [“Management Server” on page 1031](#)
- ♦ [“Management Console” on page 1032](#)
- ♦ [“Monitoring Agent Server” on page 1032](#)

Management Server

The management server comes with the robust and highly scalable Sybase* Adaptive Server Anywhere that stores static information, such as the names and addresses of the nodes and devices in your network. The management server components include the NetExplorer™, management database, Consolidator, and Atlas Manager. NetExplorer discovers the objects in your network and stores them in the management server. The Consolidator takes the information about network objects discovered by NetExplorer and builds the management database. For details about the functionality of NetExplorer, see [Section 23.1, “Understanding Network Discovery,” on page 868](#).

The management database is comprised of the Common Information Model (CIM) schema that is used to establish the topology of the network. The CIM schema extension capabilities provide the ability to organize the information in the database and give this information the shape of a network map. The Atlas Manager obtains information from the management database and displays the network map on Novell ConsoleOne.

Management Console

Novell ConsoleOne[®], the Novell[®] directory-enabled, Java*-based network management and administration tool, is the management console component. Novell ZENworks Server Management snaps in to Novell ConsoleOne and expands Novell ConsoleOne's capabilities by adding menu options, property pages for existing Novell[™] objects, and ways to browse and organize network resources. Novell ConsoleOne provides an intuitive, graphical user interface for Novell ZENworks Server Management traffic analysis. For details about the functionality of Novell ConsoleOne, see [Section 23.3, “Managing the Atlas,” on page 913](#).

Monitoring Agent Server

Before you start analyzing segments or devices on your network, you need to ensure that they are monitored. To enable monitoring, make sure you have installed the network monitoring agent software either on the management server or on an independent server in your network. For more information, see [“Management and Monitoring Services Installation”](#) in the *Novell ZENworks 7 Server Management Installation Guide*. Network monitoring agents gather information or provide services that help you monitor your network.

An agent program using parameters you have provided searches all or part of your network, gathers information you query, and presents it to you when you require it. You can use the information gathered by the agent to analyze the traffic on your network. The agent also warns you of problems, such as duplicate IP addresses, by sending an alert to Novell ConsoleOne to help you solve problems before network performance is impacted. For details about managing alarms, see [Section 24.2, “Managing the Alarm Management System,” on page 928](#).

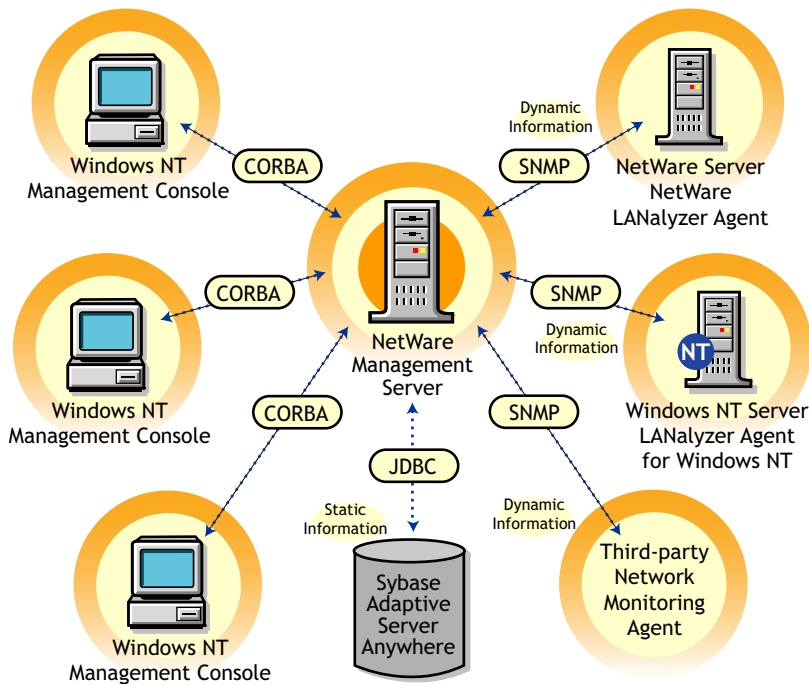

Network monitoring agents observe traffic and capture frames to build a database of network objects and information to help you detect network aberrations. With the network monitoring agent software installed on a server on each of your segments, you can use the traffic analysis tools to help you monitor the traffic on your network, identify the source of network problems, and maintain optimum performance. For details, see [“About Network Monitoring Agents” on page 1035](#). The traffic analysis agents for Novell NetWare[®] and Windows* are part of Novell ZENworks Server Management that you can use to monitor Ethernet, FDDI, or token ring networks.

29.1.2 Communication Between Traffic Analysis Components

Novell ConsoleOne communicates with the management server using common object request broker architecture (CORBA) to procure dynamic and static information about the nodes and devices in your network. When Novell ConsoleOne requests static information from the management server, the management server communicates with the management database using Java Database Connectivity (JDBC), gathers the required static information from the database, and provides it to Novell ConsoleOne. When Novell ConsoleOne requests dynamic information from the management server, the management server communicates with the network monitoring agent using SNMP, gathers the required dynamic information, and provides it to Novell ConsoleOne.

[Figure 29-1](#) illustrates this communication:

Figure 29-1 Communication among Traffic Analysis components

29.1.3 Traffic Analysis Features

The Novell ZENworks Server Management traffic analysis components provide the following features:

- ♦ [“Analyze Traffic Generated by Segments” on page 1033](#)
- ♦ [“Analyze Traffic Generated by Nodes Connected to Segments” on page 1033](#)
- ♦ [“Capture Packets, Decode Captured Packets, and Display Captured Information” on page 1034](#)
- ♦ [“Analyze Traffic Generated by Protocols” on page 1034](#)
- ♦ [“Analyze Traffic Generated by Switches” on page 1034](#)

Analyze Traffic Generated by Segments

You can use the traffic analysis tools to collect current and historical segment statistics that can be displayed in real time, stored for later display, or transferred to a database, spreadsheet, or management reporting system. For details, see [“Analyzing Traffic on Segments” on page 1050](#).

Analyze Traffic Generated by Nodes Connected to Segments

The traffic analysis tools allow you to obtain statistical information about nodes on monitored Ethernet, FDDI, or token ring segments, and determine the top nodes on a segment. You can monitor the status of nodes in your network so that you are alerted when a node becomes inactive. You can also view alarms that are generated when preset threshold parameters are exceeded. Alarms that require immediate attention can be forwarded via e-mail to remote users. For details, see [“Analyzing Traffic on Nodes Connected to a Segment” on page 1058](#).

Capture Packets, Decode Captured Packets, and Display Captured Information

You can use the traffic analysis tools to capture packets between nodes on a monitored segment, and you can quickly define a capture filter based on which you want the packets to be captured. After packets are captured, protocols are decoded and displayed in color-coded summary, decode, and hex panes. The information obtained from the captured packets can be used to examine the traffic on the segment and to analyze it. By providing analysis capabilities and advanced protocol decodes, the traffic analysis tools allow you to identify network aberrations and resolve network performance problems. For details, see [“Capturing Packets” on page 1066](#), [“Protocol Decodes Suite Supported by Novell ZENworks Server Management” on page 1044](#), and [“Displaying Captured Packets” on page 1069](#).

Analyze Traffic Generated by Protocols

You can use the traffic analysis tools to determine the distribution of protocols in the network, transport, and application layer of your network, and obtain statistical information of protocols discovered by the network monitoring agent. For details, see [“Analyzing Traffic Generated by Protocols in Your Network” on page 1076](#).

Analyze Traffic Generated by Switches

You can analyze switch traffic by using the traffic analysis tools to determine port statistics of monitored switches. For details, see [“Analyzing Traffic on Switches” on page 1079](#).

29.1.4 Traffic Analysis Fundamentals

Novell ZENworks Server Management provides tools to let you obtain statistical information about segments, nodes, and devices on your network. You can use this information to analyze and manage the performance of traffic on your network to help you keep the network operating smoothly. Novell ZENworks Server Management also provides tools to capture and decode packets between nodes. You can use the decoded information obtained from captured packets to analyze the traffic between nodes.

To be able to analyze the segments and nodes connected to a segment, you need to ensure that the segment is monitored by a network monitoring agent. You choose the agent based on the type of your network. The Novell ZENworks Server Management traffic analysis tools include the Traffic Analysis Agent for NetWare and Traffic Analysis Agent for Windows, which you can use to monitor segments in your network. NetWare 5.x, the management server for Novell ZENworks Server Management, includes Novell eDirectory, which is leveraged by Novell ConsoleOne, to enable role-based administration.

The following sections provide information that will help you understand the Novell ZENworks Server Management traffic analysis functionality:

- ♦ [“About Network Monitoring Agents” on page 1035](#)
- ♦ [“Role-Based Traffic Analysis Tasks” on page 1043](#)
- ♦ [“Protocol Decodes Suite Supported by Novell ZENworks Server Management” on page 1044](#)

About Network Monitoring Agents

Network monitoring agents provide the functionality to remotely monitor segments and devices on your network using SNMP. The agents collect and store statistical and trend information about nodes and devices on the network to provide real-time information about the status of your network. From your desktop, the agents let you troubleshoot and optimize Ethernet, FDDI, or token ring segments.

Based on the size and type of your network, you can use RMON, RMON Lite, RMON Plus, RMON2, or Bridge agents to monitor traffic. The following sections provide information to help you understand the functionality of agents:

- ◆ “Functionality of RMON Agents” on page 1035
- ◆ “Functionality of RMON Lite Agents” on page 1036
- ◆ “Functionality of RMON Plus Agents” on page 1037
- ◆ “Functionality of RMON2 Agents” on page 1039
- ◆ “Functionality of Bridge Agents” on page 1041
- ◆ “Viewing the Summarized RMON Information” on page 1042

Functionality of RMON Agents

RMON agents use a standard monitoring specification that allows various nodes and console systems on your network to exchange network data. This data can be used by a network administrator to monitor, analyze, and troubleshoot a group of distributed LANs from a central site. RMON is specified as part of the MIB in [RFC 1757](http://www.isi.edu/in-notes/rfc1757.txt) (<http://www.isi.edu/in-notes/rfc1757.txt>) as an extension of the SNMP.

RMON agents are ideally used for monitoring Ethernet, FDDI, or token ring segments.

RMON agents collect information in the nine RMON groups of monitoring elements in [Table 29-1](#), each providing specific sets of data to meet network monitoring requirements. For details, see [RFC 1757](http://www.isi.edu/in-notes/rfc1757.txt) (<http://www.isi.edu/in-notes/rfc1757.txt>).

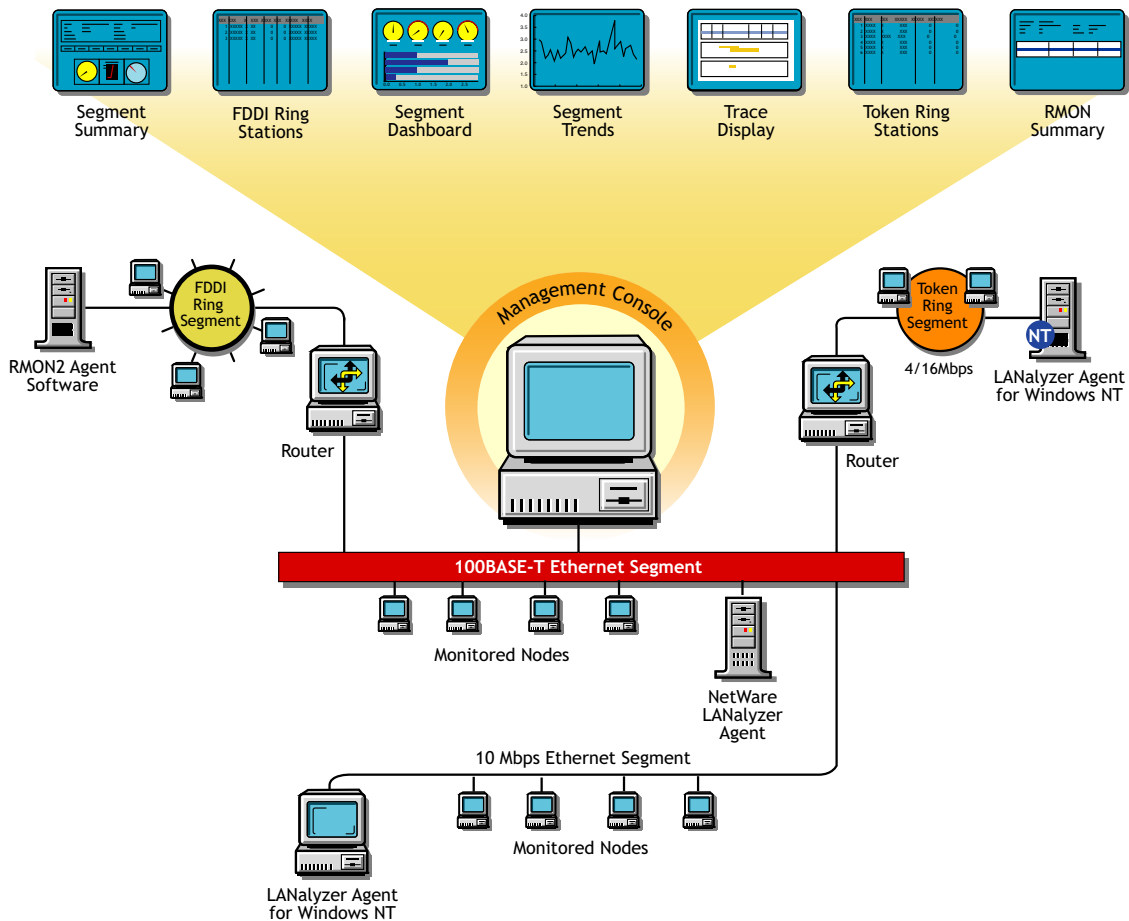

Table 29-1 List of RMON groups of monitoring elements

RMON Group	Description
Statistics	Contains statistics measured by the agent for each monitored interface on the device.
History	Records periodic statistical samples from a network and stores them for later retrieval.
Alarm	Periodically takes statistical samples from variables in the agent and compares them with previously configured thresholds. If the monitored variable crosses a threshold, an event is generated.
Host	Contains statistics associated with each host discovered on the network.
HostTopN	Prepares tables that describe the hosts that top a list ordered by one of their statistics.
Matrix	Stores statistics for conversations between sets of two nodes. As the device detects a new conversation, it creates a new entry in its table.

RMON Group	Description
Filters	Allows packets to be matched by a filter. These matched packets form a data stream that may be captured or generate events.
Packet Capture	Allows packets to be captured after they flow through a channel.
Events	Controls the generation and notification of events from the device.

Figure 29-2 illustrates the Novell ZENworks Server Management views that you can display when you use an RMON agent to monitor the nodes and devices on your network.

Figure 29-2 Novell ZENworks Server Management views available through an RMON agent

Functionality of RMON Lite Agents

RMON Lite agents are ideally used for monitoring devices not dedicated for network management. For example, RMON Lite agents can be used to monitor a switch in your network.

RMON Lite agents support the following four RMON groups:

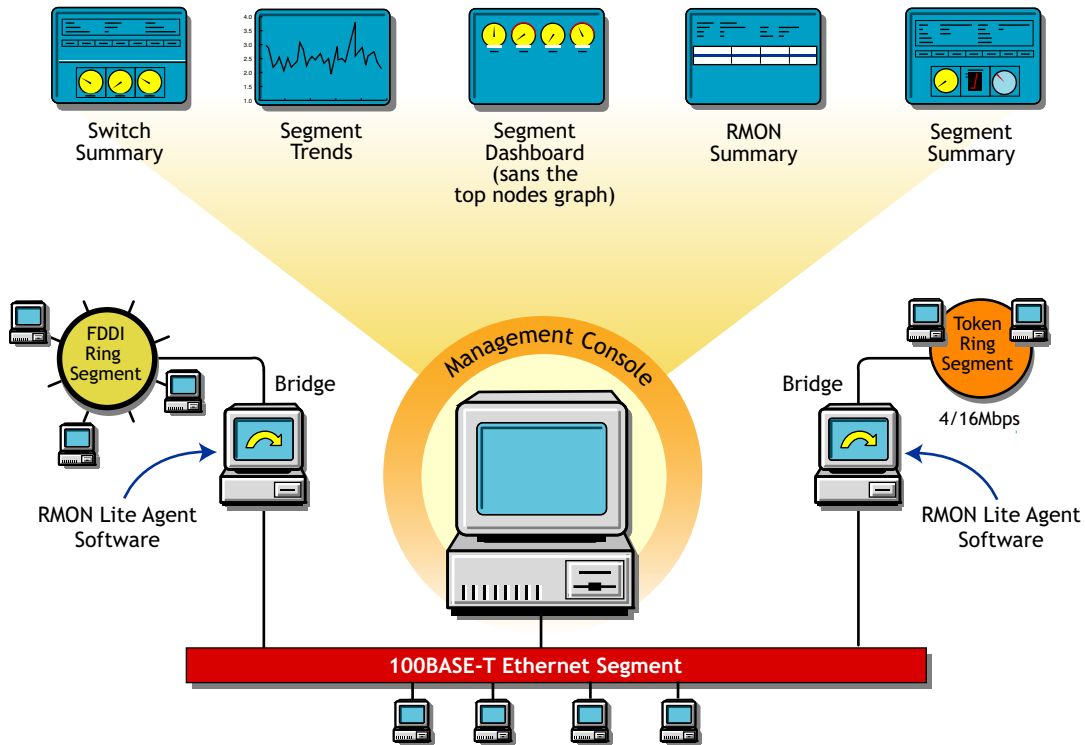

- ◆ Statistics
- ◆ History

- ◆ Alarm
- ◆ Event

Refer to the table in “[Functionality of RMON Agents](#)” on page 1035 for a brief description of each group.

Figure 29-3 illustrates the Novell ZENworks Server Management views that you can display when you use an RMON Lite agent to monitor the nodes and devices on your network.

Figure 29-3 Novell ZENworks Server Management views available through an RMON Lite agent

Functionality of RMON Plus Agents

RMON Plus agents are proprietary agents that extend the functionality of the RMON agent by providing data collected from the RMON groups, explained in “[Functionality of RMON Agents](#)” on page 1035, and the groups explained in [Table 29-2](#):

Table 29-2 Functionality of RMON Plus Agents

RMON Plus Group	Description
Buffer	Records the number of octets (excluding framing bits but including frame check sequence [FCS] octets and overhead) in packets which are captured in the buffer.
Admin	Collects information specific to the agent, such as the version number.
HostMonitor	Monitors a set of nodes for a particular host table and sets traps when a host becomes active or inactive.

RMON Plus Group	Description
DuplicateIP	Records and updates a list of packets arriving with duplicate IP addresses.
MacToIP	Stores records of the IP addresses associated with a host address for an individual host table.
BoardStatus	Records the status of each logical interface of the RMON agent.

RMON Plus agents are ideally used for monitoring Ethernet, FDDI, or token ring segments. Data from different media types can be collected based on the version of the RMON Plus agent that is used to monitor traffic on your network.

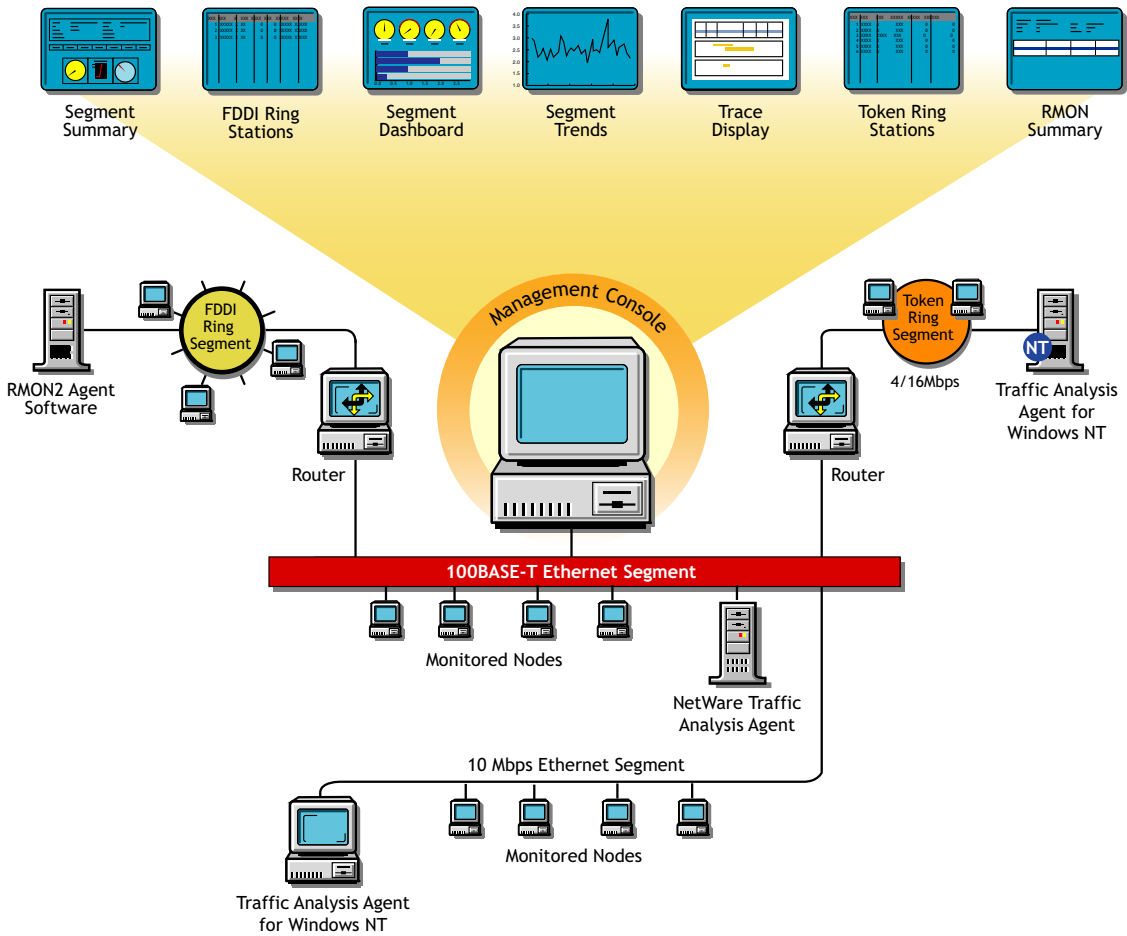

Refer to [Table 29-3](#) to determine the media type support based on the version of the RMON Plus agent:

Table 29-3 *List of Media type support based on the version of the RMON Plus agent*

RMON Plus Agent	Media Support
Traffic Analysis Agent for NetWare 1.1	Ethernet and token ring
Traffic Analysis Agent for NetWare 1.21 or later	Ethernet, FDDI, or token ring
Traffic Analysis Agent (version 1.30) for Windows	Ethernet, FDDI, or token ring

[Figure 29-4](#) illustrates the Novell ZENworks Server Management views that you can display when you use an RMON Plus agent to monitor the nodes and devices on your network.

Figure 29-4 Novell ZENworks Server Management views available through an RMON Plus agent

Functionality of RMON2 Agents

RMON agents can be used to collect data from nodes and devices in the physical and the data link layers and RMON2 agents can be used to collect data from nodes and devices in the network and application layers of your network. RMON2 agents can also determine network usage based on the protocol and application used by the nodes in your network. The RMON2 groups make it possible to view traffic patterns above the data link layer, as shown in Table 29-4. For details, see RFC 2021 (<http://www.isi.edu/in-notes/rfc2021.txt>).

Table 29-4 Functionality of RMON2 Agents

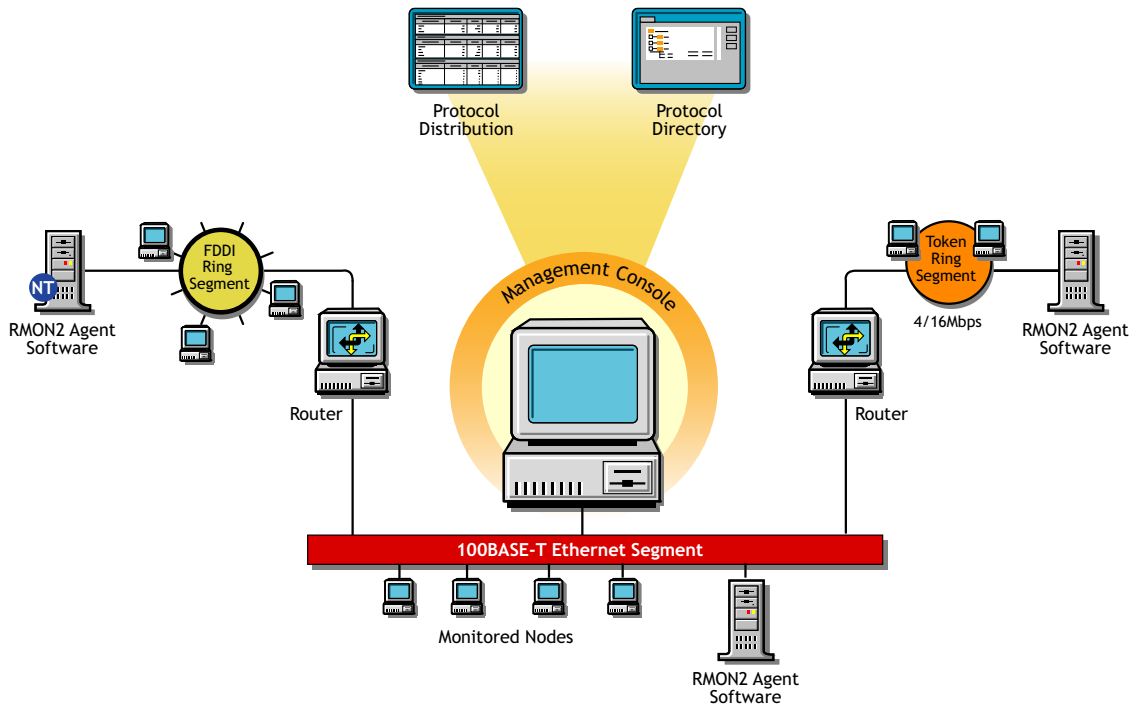

RMON2 Group	Description
Protocol Directory	Provides a table of all identifiable protocols and their descriptions.
Protocol Distribution	Provides statistics for each protocol that the agent is configured to track.
Address Map	Maps a network layer address to the corresponding Media Access Control (MAC) address.
Network-Layer Host	Provides statistics for each host by network layer address.

RMON2 Group	Description
Network-Layer Matrix	Provides statistics for each network conversation between pairs of network layer addresses.
Application-Layer Host	Provides statistics on traffic generated by each host for a specified application layer protocol. Traffic broken down by protocols can be recognized by the Protocol Directory group.
Application-Layer Matrix	Provides statistics on conversations between pairs of network layer addresses for a specified application layer protocol. Traffic broken down by protocols can be recognized by the Protocol Directory group.
User History	Enables the agent to save samples of RMON2 data for any MIB object at specified intervals.
Probe Configuration	Provides remote capability for configuring and querying agent parameters such as resets, software updates, IP address changes, and trap destinations.
RMON Conformance	Provides information to management software regarding the status of support for the groups.

IMPORTANT: The Console supports only the Protocol Directory and Protocol Distribution groups.

Figure 29-5 illustrates the Novell ZENworks Server Management views that you can display when you use an RMON2 agent to monitor the nodes and devices on your network.

Figure 29-5 Novell ZENworks Server Management views available through an RMON2 agent

Functionality of Bridge Agents

Bridges are used to connect LAN segments below the network layer. A bridge connects two or more physical networks, forwarding packets between networks based on the information in the data link header.

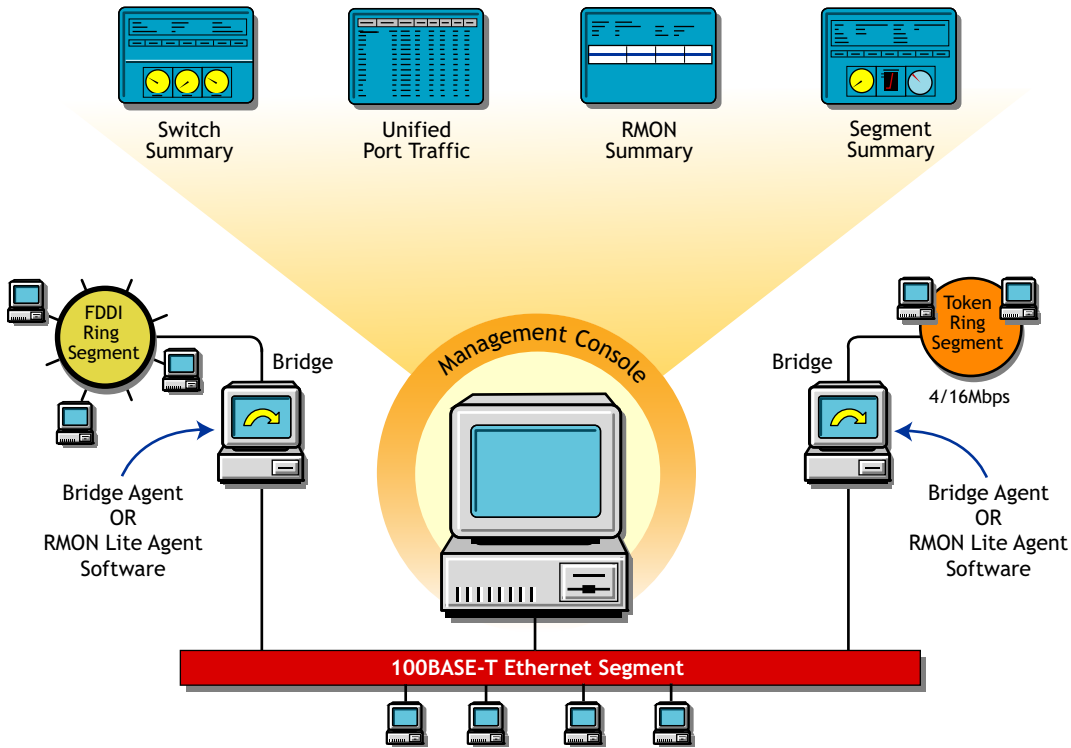

Bridge agents collect information in the five Bridge groups shown in [Table 29-5](#). You can use this information to monitor switched networks. For details, see [RFC 1493](http://www.isi.edu/in-notes/rfc1493.txt) (<http://www.isi.edu/in-notes/rfc1493.txt>).

Table 29-5 *Functionality of Bridge Agents*

Group	Description
Base	Stores information about objects that are applicable to all types of bridges.
Spanning Tree Protocol	Stores information regarding the status of the bridge with respect to the Spanning Tree Protocol.
Source Route Bridging	Provides information that describes the status of the device with respect to source route bridging.
Transparent Bridging	Provides information that describes the entity's state with respect to transparent bridging.
Static	Collects information that describes the entity's state with respect to destination address filtering.

[Figure 29-6](#) illustrates the Novell ZENworks Server Management views that you can display when you use a Bridge agent to monitor the nodes and devices on your network:

Figure 29-6 Novell ZENworks Server Management views available through a Bridge agent

Viewing the Summarized RMON Information

The RMON Summary view provides brief information about RMON service on a selected node. It displays static information about the RMON agent and details of the resources requested by the user from the agent. The resource requests that are displayed in the RMON Summary view are Packet Capture and Host TopN requests.

To view the summarized RMON information:

- 1 Click *RMON* under *Services* within a node.
- 2 Click *View > RMON Summary*.

Table 29-6 describes the static information displayed in the RMON Summary view:

Table 29-6 Static information displayed in the RMON Summary view

Statistic	Explanation
Agent Name	Name of the RMON agent monitoring the selected segment
IP Address	IP address of the node on which the RMON agent is installed
IPX™ Address	Internetwork Packet Exchange™ (IPX) address of the node on which the RMON agent is installed
Number of Interfaces	Number of logical interfaces for the management server on which the RMON agent is installed
Version	Version number of the RMON Plus agent

Statistic	Explanation
Type of RMON Service	Type of the RMON agent: RMON, RMON Plus, or RMON2
Status of the Agent	Status of the RMON agent

The RMON Summary view displays the resource information described in [Table 29-7](#):

Table 29-7 Resource information displayed in the RMON Summary view

Statistic	Explanation
Resource Name	Type of resource requested: <ul style="list-style-type: none"> ◆ Packet Capture ◆ Host TopN
Owner	Owner string corresponding to the control entry of the row
Index	Channel, Filter, or Buffer control indexes for the Packet Capture resource and the Control index for the Host TopN resource

To delete a resource:

- 1 Select a row from the Resource table.
- 2 Click *Delete*.

When you delete a resource, the entry on the agent corresponding to the selected row is deleted.

Role-Based Traffic Analysis Tasks

Novell ZENworks Server Management lets you perform the following traffic monitoring tasks based on your role:

- ◆ Add nodes to be monitored for inactivity.
For details, see [“Monitoring Nodes for Inactivity” on page 1064](#).
- ◆ Add protocols to the protocol directory tree.
For details, see [“Displaying a List of Protocols Used in Your Network” on page 1076](#).
- ◆ Capture packets.
For details, see [“Capturing Packets” on page 1066](#).
- ◆ Disable nodes from being monitored for inactivity.
For details, see [“Monitoring Nodes for Inactivity” on page 1064](#).
- ◆ Delete protocols from the protocol directory tree.
For details, see [“Displaying a List of Protocols Used in Your Network” on page 1076](#).
- ◆ Free agent resources.
For details, see [“Viewing the Summarized RMON Information” on page 1042](#).
- ◆ Set segment alarms.
For details, see [“Configuring Alarm Options from the Set Alarm Dialog Box” on page 1089](#).

- ◆ View conversations.
For details, see [“Viewing Conversations \(Traffic\) Between Nodes”](#) on page 1063.
- ◆ View Traffic Analysis Agents.
For details, see [“Selecting the Preferred RMON Agent”](#) on page 1048.
- ◆ View the protocol directory.
For details, see [“Determining the Distribution of Protocols in a Segment”](#) on page 1078.
- ◆ View the RMON summary.
For details, see [“Viewing the Summarized RMON Information”](#) on page 1042.
- ◆ View segment alarms.
For details, see [“Viewing Alarm Statistics for a Segment”](#) on page 1056.
- ◆ View the segment dashboard.
For details, see [“Determining the Performance of Individual Segments”](#) on page 1052.
- ◆ View segments monitored for inactivity.
For details, see [“Monitoring Nodes for Inactivity”](#) on page 1064.
- ◆ View segment protocol distribution.
For details, see [“Determining the Distribution of Protocols in a Segment”](#) on page 1078.
- ◆ View segment stations.
For details, see [“Listing Statistics for Segments”](#) on page 1051.
- ◆ View the segment summary.
For details, see [“Viewing the Summarized Segment Information”](#) on page 1057.
- ◆ View segment trends.
For details, see [“Analyzing Traffic on Segments”](#) on page 1050.
- ◆ View switch or port traffic.
For details, see [“Viewing Statistics for Ports in a Switch”](#) on page 1080.
- ◆ View the switch summary.
For details, see [“Viewing the Summarized Switch Information”](#) on page 1080.

For more information about role-based services, see [Section 21.3, “Role-Based Administration,”](#) on page 834.

Protocol Decodes Suite Supported by Novell ZENworks Server Management

Novell ZENworks Server Management decodes several protocol suites. Using Novell ZENworks Server Management, you can analyze and troubleshoot problems in the following protocol suites:

- ◆ Novell NetWare Protocol Suite
- ◆ NetWork File System Protocol Suite
- ◆ Systems Network Architecture Protocol Suite
- ◆ AppleTalk* Protocol Suite
- ◆ TCP/IP Protocol Suite

You need to understand these protocols in order to set up packet capture and interpret the results in the Trace Display window. For more information about these protocol suites and decoding support, see [Appendix 31, “Protocol Decodes Suites Supported by Novell ZENworks Server Management,” on page 1141](#)

Novell ZENworks Server Management also enables you to analyze and troubleshoot problems in the following media:

- ◆ Standard Ethernet
- ◆ IEEE 802.3
- ◆ Token Ring
- ◆ FDDI

29.2 Planning for Segment Monitoring

A baseline defines the typical activity of your network. Keeping a baseline document of activity on a segment lets you determine when the activity is atypical. Atypical activity might be caused by a problem or network growth. To create a baseline activity, you should gather statistical information when the network is functioning typically.

The following sections provide information about creating and using a baseline:

- ◆ [Section 29.2.1, “Creating a Baseline of Typical Segment Activity,” on page 1045](#)
- ◆ [Section 29.2.2, “Using the Baseline Document,” on page 1045](#)
- ◆ [Section 29.2.3, “Segment Baseline Document Tips,” on page 1046](#)

29.2.1 Creating a Baseline of Typical Segment Activity

For segment statistics such as bandwidth utilization, you should create a trend graph that plots information over a period of time. Statistics sampling that gathers data over a short period of time can be misleading. If you have added one or more network components, it is useful to create another baseline against which you can compare future activity.

You can export the data you gather in Novell ZENworks Server Management into programs, such as spreadsheets, for further analysis and to maintain records over time.

29.2.2 Using the Baseline Document

You can use the baseline document for the following purposes:

- ◆ [“Using Baseline Documents to Set Alarm Thresholds Appropriately” on page 1046](#)
- ◆ [“Using Baseline Documents to Track Network Growth and Its Effect on Performance” on page 1046](#)
- ◆ [“Using Baseline Documents to Troubleshoot Atypical Segment Activity” on page 1046](#)

Using Baseline Documents to Set Alarm Thresholds Appropriately

Novell ZENworks Server Management lets you set alarm thresholds for statistics on segments monitored by the network monitoring agent software, so that if the threshold is exceeded, you are notified at Novell ConsoleOne. Setting alarm threshold values for statistics on a segment eliminates the need for you to constantly monitor segments for problems.

Novell ZENworks Server Management provides default values for thresholds of various alarms on Ethernet, FDDI, and token ring segments. Refer to the table in [“Configuring Alarm Options from the Set Alarm Dialog Box” on page 1089](#) for a list of alarm statistics tracked by Novell ZENworks Server Management. By creating a baseline of activity on the segment, you can determine whether the default values are appropriate for segments in your network. For example, after tracking segment utilization, you would set an alarm threshold for bandwidth utilization at about 5% to 10% higher than typical utilization. You are then alerted if utilization is greater than usual for that segment.

IMPORTANT: If you want to use this alarm notification feature, you must enable segment alarms.

Using Baseline Documents to Track Network Growth and Its Effect on Performance

By comparing current network performance against the performance recorded in your baseline document, you can determine how performance is affected by network changes. This comparison also helps you plan for network growth and justify network upgrades and expansion. You can view graphs of real-time trends for various Ethernet, FDDI, and token ring statistics. If an RMON2 agent is installed on a segment, you can also view historical trends for those statistics over hourly, daily, weekly, monthly, and yearly periods. Refer to [“Analyzing Trend Data for a Segment” on page 1053](#) for details about how to view a trend of segment performance. Refer to the table in [“Choosing Options to Display Stations on a Segment” on page 1082](#) for a list of statistics based on which you can display a trend of segment performance.

Using Baseline Documents to Troubleshoot Atypical Segment Activity

By knowing what the typical network activity is, you can recognize atypical activity, which might help you isolate the cause of a problem.

29.2.3 Segment Baseline Document Tips

You should include the following key characteristics in each network baseline document:

- ♦ [“Bandwidth Utilization” on page 1046](#)
- ♦ [“Packets Per Second” on page 1047](#)
- ♦ [“Network Error Rates” on page 1047](#)
- ♦ [“Kilobytes Per Second” on page 1047](#)
- ♦ [“Most Active Servers on the Segment” on page 1047](#)

Bandwidth Utilization

The bandwidth utilization statistic indicates the percentage of network bandwidth used. Bandwidth utilization is likely to be higher at certain times during the day (for example, when users log in to the network in the morning), week, or month. Tracking bandwidth utilization helps you balance traffic

loads among network segments, servers, and routers for a more efficient network. This information also helps you determine the effect of network growth on performance. As new workstations and applications are added to a network, bandwidth utilization typically increases.

Packets Per Second

Monitoring the number of packets on the wire provides information about the traffic on the segment. By looking at the change in the packets per second after a user launches a new application, you can calculate what the increase in packets per second will be when all the users you expect to use the application start using it. Packets per second differs from utilization. Utilization is based on the number of kilobytes on the segment per second, but packets can range in size. Therefore, utilization can increase as a result of an increase in the size or number of packets. If the number of packets increases but utilization does not, it is likely that the number of small packets increased but the increase did not affect utilization.

Network Error Rates

By including error rates in your baseline, you can determine when error rates on the network are atypical. This is important because network errors can bring down the network. A higher error rate can result from a hardware problem or network growth. If errors increase but utilization does not, there might be a problem with a component, for example a faulty network board or transceiver.

Kilobytes Per Second

Tracking kilobytes per second lets you determine the throughput of your network. From this information, you can determine the percentage of the total possible bandwidth that is in use. For Ethernet networks, the maximum possible utilization is 10 Mbps. For token ring networks, the maximum possible utilization is 4 or 16 Mbps (depending on the hardware).

Most Active Servers on the Segment

Keeping track of the top three servers on the network helps you distribute the load among them as you add new users and applications. See [“Viewing Statistics of the Top 20 Nodes” on page 1059](#) for details about how to display a list of top nodes on a monitored segment. You should also monitor the number of Request Being Processed packets. A constantly increasing number of these packets indicates a server overload condition. You can monitor these packets by doing a packet capture and decode. See [“Capturing Packets” on page 1066](#) and [“Displaying Captured Packets” on page 1069](#) for details about how to capture and display decoded packets.

With the Segment Trends view, you can view many segment statistics and export that data into another application (such as a spreadsheet) for later analysis. The data is saved as a text file that stores statistical values of the trend you display. To export the trend data to a file, click the Export button in the toolbar of the Segment Trends view. For details, see [“Analyzing Trend Data for a Segment” on page 1053](#).

You can view current utilization for a segment through the Segment Dashboard view. To access this view, select a segment, click View > click Segment Dashboard. For details, see [“Determining the Performance of Individual Segments” on page 1052](#).

29.3 Preparing to Analyze Network Traffic

The Novell ZENworks Server Management software components include the Traffic Analysis Agent for NetWare and Traffic Analysis Agent for Windows. You can install the network monitoring agent on the management server or on an independent NetWare or Windows server. The agent monitors the traffic on the segment it is connected to, gathers information about the nodes and devices on that segment, and makes this information available to the management server, which provides it to Novell ConsoleOne. The agent also sends traps to the management server that are forwarded to Novell ConsoleOne. The management server and the monitoring agent communicate using SNMP. Novell ZENworks Server Management provides default values for SNMP parameters.

The following sections provide information about specifying a preferred agent for monitoring traffic on the segment and changing the default SNMP settings:

- [Section 29.3.1, “Selecting the Preferred RMON Agent,” on page 1048](#)
- [Section 29.3.2, “Setting Up SNMP Parameters,” on page 1049](#)

29.3.1 Selecting the Preferred RMON Agent

If more than one remote monitor (RMON) agent exists on a selected segment, you can choose which agent is to monitor the nodes on the segment from the RMON Agent property page. This page displays a list of servers on which the RMON Agent is installed. The agent installed on the server that you choose from this list becomes the preferred agent. The preferred agent is the primary agent that monitors the segment and sends information about segment activity to Novell ConsoleOne.

To display the RMON Agent property page:

- 1 Select a segment in Novell ConsoleOne.
- 2 Click *File > Properties > the RMON Agent* tab.

[Table 29-8](#) describes the statistics displayed in the RMON Agent property page:

Table 29-8 *List of statistics displayed in the RMON Agent property page*

Statistic	Explanation
Preferred	Displays a check mark if the selected server is chosen to be the preferred RMON agent server.
Agent Name	Displays a list of all the servers on which the RMON agent is installed.
Version	Displays the version of the RMON agent installed on the server. The version is dynamically obtained. If Novell ZENworks Server Management cannot connect to the remote agent, or if a third-party agent is installed on the selected segment, this field is blank.
Status	Displays the status of the RMON agent on the segment.
MAC Address	Displays the physical Media Access Control (MAC) address of the node.
Interface Index	Displays the number of interface indexes in which each interface corresponds to a segment that the node can connect through the network board.

Statistic	Explanation
Available RMON Services	Displays the list of RMON services available from the selected agent: RMON, RMON Plus, or RMON2.

To choose an RMON agent as the preferred agent:

- 1 Choose a server or workstation name from the list of names displayed in the property page.
The server and workstation names displayed are those on which the RMON agent is installed.
- 2 Click *Apply*.

29.3.2 Setting Up SNMP Parameters

When you request dynamic information to be displayed in Novell ConsoleOne, it seeks the information from the management server. The management server communicates with the network monitoring agent using SNMP, obtains the required information from the agent, and provides it to Novell ConsoleOne. SNMP communications between the server and the agent are based on default SNMP settings provided by Novell ZENworks Server Management. You can change the default SNMP settings using the SNMP dialog box, which displays in Novell ConsoleOne if an error occurs when the management server is communicating with the monitoring agent.

You can use the SNMP dialog box to specify the community strings and security settings for SNMP communication. You can change the default time-out value for the server to connect with the agent. If the default time-out value is exceeded before the server can communicate with the agent or if the community string of the server does not match that of the agent, the SNMP dialog box displays in Novell ConsoleOne with the current settings. You can use the dialog box to change the current time-out value, the community string, and other SNMP parameters. The changed values are saved in the Novell ZENworks Server Management database and will be applied for all subsequent traffic management sessions.

To change the SNMP settings for all monitoring agents in your network:

- 1 In Novell ConsoleOne, right-click the Novell ZENworks Server Management domain, then click *Global SNMP Parameters*.

To change the SNMP settings for a specific agent:

- 1 In Novell ConsoleOne, right-click the node on which the agent is installed, then click *Properties > SNMP Settings*.

Table 29-9 describes the SNMP parameters displayed in the SNMP Settings property page:

Table 29-9 List of SNMP parameters displayed in the SNMP Settings property page

Parameter	Explanation
Community String	Community string of the node requesting dynamic data from the agent
Timeout	Maximum duration the server should wait for a response from the agent
Retry	Number of times the server should try to connect with the agent
Secure Set	Encrypts the packet sent by the management server to the monitoring agent

Parameter	Explanation
Secure Get	Encrypts the packet sent by the monitoring agent to the management server

TIP: If the network monitoring agent is running on NetWare 4.x and your network is IPX enabled, use the SNMP dialog box to communicate with the agent using IPX. This will significantly improve the performance of Novell ZENworks Server Management traffic analysis components.

29.4 Analyzing Network Traffic

You can use Novell ZENworks Server Management to monitor your network and collect information such as a summary of real-time statistics to determine the performance of your network, or detailed real-time statistics to determine the performance of segments in your network.

Information about the activity of nodes and segments in your network is presented in views containing tables, dials, and graphs. You can use the information to perform various traffic management tasks such as establishing a baseline on your network to help you identify typical traffic loads and control network problems, and analyze real-time performance to help you balance traffic loads among network segments, servers, and routers. You can also collect node information to help you focus on specific entities that might be the source of problems.

The following sections provide detailed information about how you can use Novell ZENworks Server Management to manage your network monitoring activities:

- ♦ [Section 29.4.1, “Analyzing Traffic on Segments,” on page 1050](#)
- ♦ [Section 29.4.2, “Analyzing Traffic on Nodes Connected to a Segment,” on page 1058](#)
- ♦ [Section 29.4.3, “Capturing Packets,” on page 1066](#)
- ♦ [Section 29.4.4, “Displaying Captured Packets,” on page 1069](#)
- ♦ [Section 29.4.5, “Analyzing Traffic Generated by Protocols in Your Network,” on page 1076](#)
- ♦ [Section 29.4.6, “Analyzing Traffic on Switches,” on page 1079](#)

29.4.1 Analyzing Traffic on Segments

Monitoring the segments on your network helps you keep the network operating cost effectively, consistently, and smoothly. Based on the kind of information you want to obtain, you can choose the agent that will monitor the segments on your network. For details, see [“About Network Monitoring Agents” on page 1035](#). The agent monitoring the segments will collect traffic data and provide real-time or historical information to you when you require it.

Novell ZENworks Server Management provides various views you can use to obtain statistical information about monitored segments. You can choose to view statistical information for all segments in your network or for individual segments. You can view a trend of segment performance and a list of alarms generated on a segment. The Segment Summary view provides a summary of segment performance.

The following sections provide information to help you analyze the performance of segments in your network:

- ♦ [“Listing Statistics for Segments” on page 1051](#)
- ♦ [“Determining the Performance of Individual Segments” on page 1052](#)

- ◆ [“Analyzing Trend Data for a Segment” on page 1053](#)
- ◆ [“Viewing Alarm Statistics for a Segment” on page 1056](#)
- ◆ [“Viewing the Summarized Segment Information” on page 1057](#)

TIP: Servers running the remote monitor (RMON) agent can notify you when nodes you selected for monitoring become inactive. For details, see [“Monitoring Nodes for Inactivity” on page 1064](#). Sometimes the RMON agent server must be taken off the network for maintenance. To prevent the segment from going unmonitored, you can choose a different RMON agent on the segment. For details, see [“Selecting the Preferred RMON Agent” on page 1048](#).

Listing Statistics for Segments

The List Segments view displays a list of segments and statistical information for each segment on your network. Statistics are displayed in columns of the table in the view. The view displays a list of segments associated with the object or node you selected in Novell ConsoleOne.

See [“Analyzing Traffic on Nodes Connected to a Segment” on page 1058](#) for details about how to use Novell ZENworks Server Management to get information about nodes on individual segments.

To view statistical information of all segments:

- 1 In Novell ConsoleOne, select an Area or a node.
- 2 Click *View > List Segments*.

If you select an Area, the List Segments view displays statistics for all segments found within that Area. If you select a node, statistics for all segments connected to that node will be displayed.

[Table 29-10](#) describes the statistics displayed for each segment. The sampling interval for updating statistics on segments is 15 seconds.

TIP: Statistics of segments are displayed in the List Segments view only if the segments are monitored by a Traffic Analysis Agent for NetWare or Traffic Analysis Agent for Windows.

Table 29-10 *Statistical information of each segment*

Statistic	Explanation
Segment Name	Segment name or address.
Type	Physical segment type: Ethernet, FDDI, token ring, PPP, and unknown. Unknown indicates the segment whose physical segment type is other than the one listed.
Speed (Mbps)	The speed of the segment, as determined by the speed of the network board that attaches the RMON agent to the segment and factors such as the cable type of the segment. The value in this column appears only if you have at least one RMON agent connected to at least one server on your network.
Utilization%	Average percentage of the bandwidth currently used by all traffic on the segment.
Packets/s	Average number of packets per second currently transmitted on the segment.
KBytes/s	Average number of kilobytes per second currently transmitted on the segment.

Statistic	Explanation
Errors/s	Average number of errors per second currently appearing on the segment.
Message	Status of the RMON Agent on the segment. For details, see “Selecting the Preferred RMON Agent” on page 1048.

As Novell ZENworks Server Management polls segments, messages in the Messages column vary. These messages display the status of the preferred RMON agent on the segment.

The preferred RMON agent is the node you selected to send information about the segment to Novell ConsoleOne. You can make this selection from the RMON Agent property page. For details, see [“Selecting the Preferred RMON Agent” on page 1048.](#)

You can modify the view to show fields; format columns; sort and group items; change the font of text fields; or display grid lines in the table view by selecting the required option from *View > Settings*. For details, see [Chapter 23, “Understanding Network Discovery and Atlas Management,” on page 867.](#)

Determining the Performance of Individual Segments

Novell ZENworks Server Management provides real-time statistical information about the monitored segment on your network. This information is displayed in the Segment Dashboard view. The information displayed in this view is useful if you want to troubleshoot a segment.

The Segment Dashboard view displays four gauges that display the real-time statistics for a monitored segment. The lower portion of the view displays a bar graph of the top eight nodes, based on the value selected from the drop-down list. By default, it is based on packets out per second. See [“Viewing Statistics of the Top 20 Nodes” on page 1059](#) for details about how to display a list of the most active nodes on a monitored segment.

You can configure the Segment Dashboard view to display the top eight nodes based on a different statistic. You can also choose to display or disable the top nodes graph. For details, see [“Choosing Options to Display Stations on a Segment” on page 1082.](#)

You can set alarm threshold values on segment alarms for packets per second, broadcasts per second, and utilization percentage statistics displayed in the Segment Dashboard view. For details, see [“Defining Alarm Thresholds for Statistics Displayed in the Segment Dashboard View” on page 1053.](#)

To view statistical information of an individual segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Segment Dashboard*.

The Segment Dashboard view displays four gauges that display real-time statistics for a monitored segment. The peak value is indicated by a line on each bar in the graph. [Table 29-11](#) describes the statistics displayed in the Segment Dashboard view.

Table 29-11 Statistical information displayed in the Segment Dashboard view

Statistic	Explanation
Packets/s	Number of packets per second currently transmitted on the segment

Statistic	Explanation
Utilization%	Percentage of maximum network capacity currently consumed by packet traffic on the segment
Error/s	Number of error packets per second currently transmitted on the segment
Broadcasts/s	Number of broadcast packets per second currently transmitted on the segment (a broadcast packet is sent to all addresses on the segment)

Statistics are updated every five seconds. The numeric value of each statistic is displayed in the gauge.

Defining Alarm Thresholds for Statistics Displayed in the Segment Dashboard View

To set alarm threshold values for statistics displayed in the Segment Dashboard view:

- 1 Click the black ring outlining the gauge.
- 2 Drag the ring to increase or decrease the default values.
As you drag the ring, the color of the ring changes to red.
- 3 Stop at the value you want to set as the threshold value for the statistic.
The color of the ring is displayed in red up to the selected threshold value.
If the statistic on the monitored segment exceeds the threshold value, the RMON agent sends a trap to the management server, which forwards it to Novell ConsoleOne and an alarm is generated.

Viewing the Graph of the Top Nodes on a Monitored Segment

The lower portion of the Segment Dashboard view displays a bar graph of the top eight nodes on a monitored segment. The default statistic on which the graph is based is packets out per second. You can change the statistic on which the graph is based. For details, see [“Choosing the Statistic Based on Which Top Nodes Graph Is Displayed” on page 1086](#). You can also choose to display or disable the top nodes graph. For details, see [“Choosing Options to Display the Top Nodes Graph” on page 1086](#).

Statistics for the graph are updated every five seconds. Every 60 seconds, the graph is re-sorted and the new top nodes are displayed. At this point, new nodes might be added and existing nodes might be discarded from the list.

Analyzing Trend Data for a Segment

Novell ZENworks Server Management allows you to determine trends of traffic patterns on the monitored segment. You can view the trend of segment performance from the Segment Trends view. You can use trend information to create a baseline of typical activity on segments. Having a baseline helps you set appropriate thresholds for segment alarms and plan maintenance activities and backups. Additionally, if problems occur on the segment, you can compare the typical traffic level against the atypical traffic level to help you discover the cause of the problem. For details, see [“Creating a Baseline of Typical Segment Activity” on page 1045](#).

The following topics will help you analyze trend data:

- ◆ [“Understanding the Trend Display” on page 1054](#)
- ◆ [“Viewing Trend Statistics” on page 1054](#)

Understanding the Trend Display

Segment trend data is displayed depending on the type and settings of the RMON agent monitoring the selected segment.

- ♦ If RMON Plus is the segment's preferred RMON agent, you can view current trends gathered every 30 seconds over the last hour and historical trends displayed over hourly, daily, weekly, monthly, or yearly periods.

IMPORTANT: If an RMON agent is installed on more than one node on a segment, the node you select in the RMON Agent property page as the node to send information about the segment to Novell ConsoleOne is the preferred RMON agent server. For more details, see [“Selecting the Preferred RMON Agent” on page 1048](#).

- ♦ If RMON Plus is not selected as the preferred RMON agent for the segment, you can view only the current trends for the selected segment. Current trends are gathered every 30 seconds over the last hour. Select an RMON Plus agent as the preferred RMON agent for the segment to be able to view historical trends.
- ♦ If the preferred RMON agent is Traffic Analysis Agent for NetWare version earlier than 1.30, you can view current trends gathered over the past hour and trends for the past day.
- ♦ Real-time trends will not be displayed if memory usage is excessive or if configuration settings in the RMON agent are unacceptable.
- ♦ If the RMON agent is down or is experiencing problems, the trend for a monitored segment will be displayed as a broken graph.
- ♦ If the preferred RMON agent is a Novell Traffic Analysis Agent (version 1.30 or greater) or a third-party agent that implements the token ring Extensions to the Remote Network Monitoring MIB (RFC 1513), the segment bandwidth utilization graph displays slightly lower values than the actual utilization in the trend for the token ring segment view. This is because the MAC layer statistics are not taken into consideration for the utilization calculation.

Viewing Trend Statistics

To view the trend statistics for a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Segment Trends*.

Trend graphs are displayed for Ethernet, FDDI, and token ring segments. The default statistics, based on which graphs are displayed for the three types of segments, are shown in [Table 29-12](#):

Table 29-12 *Segment Type Default Statistics*

Segment Type	Default Statistic
Ethernet	Total packets, good packets, and error packets
FDDI	Total packets
Token ring	Total packets

The toolbar options let you change the time span of the trend you view, select statistics based on which you want the graph to be displayed, and export data to a file.

Table 29-13 describes the toolbar options in detail:

Table 29-13 *Toolbar Options of Segment Trends*

Option		Explanation
<i>Profile</i>		<p>Displays the Profile dialog box, from which you can select a default profile. The default profile displays a trend with statistical information for total packets, good packets, and error packets on the monitored segment.</p> <p>If you choose not to use the profiles listed in the <i>Select Profile</i> list, you can select the required statistics from the <i>Select Statistics</i> list. You can save the selected statistics if you want to display the trend of a different segment based on the statistics you selected. The default profile will be enabled the next time you launch the Segment Trends view.</p>
<i>Legend</i>		Shows what each color in the graph represents. The Legend can be resized.
<i>Stack</i>		Stacks the trends in a single graph representing all selected statistics, on a single vertical axis.
<i>Unstack</i>		Un-stacks the trends and displays the graph as a separate strip for each statistic.
<i>Horizontal Grid</i>		Displays horizontal grid lines in the graph area of the Segment Trend view.
<i>Vertical Grid</i>		Displays vertical grid lines in the graph area of the Segment Trends view.
<i>Scale To Fit</i>		Maximizes or minimizes the graph to fit the trend entirely in the graph area of the view.
<i>Export</i>		Copies the information in the Segment Trends view to a file. The file stores the statistical values displayed by the trend. You can save the data for later analysis.

Option	Explanation
<i>Time Scale</i> drop-down list 	<ul style="list-style-type: none"> ◆ Real Time: Displays a current trend graph. The default sampling time for this graph is once every minute. This graph updates in real time. ◆ One Hour: Displays a historical graph of the selected trend with a time span of one hour. ◆ One Day: Displays a historical graph of the selected trend with a time span of one day. ◆ One Week: Displays a historical graph of the selected trend with a time span of one week. ◆ One Month: Displays a historical graph of the selected trend with a time span of one month. ◆ One Year: Displays a historical graph of the selected trend with a time span of one year. <p>Historical trends such as hourly, daily, weekly, monthly, and yearly trends are available only when Traffic Analysis Agent for NetWare version 1.1 or later is installed on the segment's preferred traffic analysis agent server.</p>

The File menu of the Segment Trends view can be used to print the statistical information of the current trend or to export the statistical information of a trend to a file and store the data in text format. You can later import the file into a spreadsheet for analysis.

You can view earlier or ensuing trends and change the size of the graph by using the options available in the graph area of the Segment Trends view, as shown in [Table 29-14](#):

Table 29-14 List of options available in the graph area of the Segment Trends view

Option	Description
<i>Scale Up</i> 	Increments the Y-axis of the graph by half the current size with each click.
<i>Scale Down</i> 	Decrements the Y-axis of the graph by half the current size with each click.
<i>Previous</i> 	Displays the preceding graph based on the profile or statistics chosen. Enabled only when historical trends are displayed.
<i>Next</i> 	Displays the subsequent graph. Enabled only when historical trends are displayed.

Viewing Alarm Statistics for a Segment

Novell ZENworks Server Management tracks alarm statistics for segments. Alarms are generated when threshold values for statistics on a segment are exceeded. You can view a list of all the alarms for the monitored segment in the Segment Alarms property page.

To view alarm statistics for a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *File > Properties > Segment Alarms* tab.

Novell ZENworks Server Management provides default threshold values for various segment alarms. You can enable or disable the default values for a monitored segment. If you choose not to use the default values, you can set the threshold value using the Set Alarm dialog box. See [“Configuring Alarm Options from the Set Alarm Dialog Box” on page 1089](#) for details about how to set segment alarms.

If a segment does not have an RMON agent connected to it, an error message is displayed.

Viewing the Summarized Segment Information

The Segment Summary view provides brief information about a monitored segment in your network. It displays static information about the monitored segment, whether the segment is monitored or not, and information about the alarms generated on the segment. At a glance, you can determine the utilization of network capacity by nodes on the monitored segment, view a trend based on packets transmitted by nodes on the segment, and see the distribution of protocols on the segment.

To view the summarized segment information:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Segment Summary*.

[Table 29-15](#) describes the static information displayed in the Segment Summary view.

Table 29-15 *Static information displayed in the Segment Summary view*

Statistic	Explanation
Name	Name of the segment
Type	Media type of the segment: Ethernet, FDDI, or token ring
IP Address	IP addresses of the segment
IPX Address	IPX address of the segment
Primary Agent	Name of the preferred agent monitoring the nodes and traffic on the segment
Agent Status	Status of the preferred agent monitoring the nodes and traffic on the segment
Nodes	Number of nodes on the segment
IP Nodes	Number of nodes on the segment that have an IP address
IPX Nodes	Number of nodes on the segment that have an IPX address
Servers	Number of NetWare servers on the segments
Workstations/Others	Number of nodes on the selected segment that are not NetWare servers
Network Probes	Number of monitoring agents on the selected segment
Switches	Number of switches on the segment

Statistic	Explanation
Routers	Number of routers used to connect nodes and devices on the segment
Hubs	Number of hubs on the segment

The Segment Summary view displays information about alarms generated on a monitored segment, as described in [Table 29-16](#):

Table 29-16 *List of alarms generated on a monitored segment*

Statistic	Explanation
Severity	Severity level attributed to the trap.
From	Network address of the device that sent the alarm to the alarm management system.
Summary	Summary of the event, often including the name or address of the object affected by the alarm.
Owner	Segment or device affected by the alarm.
Received Time	Date and time when the alarm management system received the alarm.
Type	Generic description of the alarm, for example, Volume out of disk space.
Category	Displays the category of the alarm based on the MIB that defines the trap-type objects. The category is directly related to the MIBs included in the management server MIB pool. For example, the category for NetWare servers is based on the NetWare Server Alarm MIB.

The Segment Summary view displays dynamic information about a monitored segment, as described in [Table 29-17](#):

Table 29-17 *Dynamic information displayed in the Segment Summary view*

Statistic	Explanation
Utilization%	Displays a dial representing the real-time values of the network capacity consumed by packet traffic on the segment.
Packets	Displays the trend based on packets transmitted on the segment. Displays real-time trends for segments monitored by RMON agents and daily trends for segments monitored by RMON Plus agents.
Protocol Distribution	Displays a pie chart representing the distribution of application layer protocols for which the agent monitoring the segment can collect data. Each slice represents a protocol suite. Click a slice to view the names of protocols. Enabled if the agent monitoring the selected segment is an RMON2 agent.

29.4.2 Analyzing Traffic on Nodes Connected to a Segment

Novell ZENworks Server Management provides various views you can use to obtain information about nodes connected to the monitored segments in your network.

The following sections provide information that will help you monitor the performance of nodes connected to the segments in your network:

- ♦ [“Viewing Statistics of the Top 20 Nodes” on page 1059](#)
- ♦ [“Viewing Statistics of Nodes on an FDDI Segment” on page 1060](#)
- ♦ [“Viewing Statistics of Nodes on a Token Ring Segment” on page 1061](#)
- ♦ [“Viewing Conversations \(Traffic\) Between Nodes” on page 1063](#)
- ♦ [“Monitoring Nodes for Inactivity” on page 1064](#)

Viewing Statistics of the Top 20 Nodes

You can use Novell ZENworks Server Management to determine the statistics of the most active nodes on a segment for a wide range of performance statistics. This is useful if you want to discover which node is generating the most traffic based on a particular statistic. For example, you can find the heaviest source of broadcast traffic.

The Stations view displays a list of all nodes on a monitored segment. You can use this view to determine the top 20 nodes on a monitored segment. The view lists the top 20 stations sorted by packets out per second. You can choose a different statistic based on which you want the top 20 nodes to display. For details, see [“Choosing a Statistic Based on Which Top 20 Nodes Are Displayed” on page 1082](#). If there are fewer than 20 top nodes, only the available number of top nodes are listed.

To view the statistics of the top 20 nodes on a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Stations*.
- 3 From the Stations view, click *View > Show Top N Stations*.

The Stations view displays columns that provide statistical information for each station. [Table 29-18](#) describes the statistics displayed in the Stations view:

Table 29-18 *Statistics displayed in the Stations view*

Statistic	Explanation
MAC Address	Physical Media Access Control (MAC) address of a node
Node	Name of the node (or address, if the name is not in the database)
Util. %	Percentage of maximum network capacity consumed by packets sent by a node
Packets/s In	Packets per second received by a node
Packets/s Out	Packets per second transmitted by a node
Bytes/s In	Bytes per second received by a node
Bytes/s Out	Bytes per second transmitted by a node
Errors/s	Errors per second transmitted by a node
Broadcasts/s	Broadcast packets per second transmitted by a node

Statistic	Explanation
Multicasts/s	Multicast packets per second transmitted by a node (packets transmitted to a specific group of nodes)
Protocols	Types of protocols used by a node
First Transmit	Date and time a node first transmitted since the traffic analysis agent was started
Last Transmit	Date and time a node last transmitted since the traffic analysis agent was started

Stations statistics are updated periodically. Every 60 seconds, the table is resorted and new top nodes are displayed. At this point, new nodes might be added and existing nodes might be discarded from the list.

Viewing Statistics of Nodes on an FDDI Segment

Novell ZENworks Server Management lets you display data for nodes on monitored FDDI ring segments to help troubleshoot problems.

The FDDI Ring Stations view displays statistics for individual nodes on the monitored FDDI ring segment. The view lists the nodes on the segment and shows the order of each node on the ring and which node is the active monitor.

To view the statistics of nodes on an FDDI ring segment:

- 1 In Novell ConsoleOne, select an FDDI ring segment.
- 2 Click *View > FDDI Stations*.

The statistics shown for each node are cumulative since the Traffic Analysis Agent for NetWare was last started and are updated every ten seconds as described in [Table 29-19](#):

Table 29-19 *Statistics of nodes on an FDDI ring segment*

Statistic	Explanation
Order	Relative position of the node on the FDDI ring from the traffic analysis agent.
Name	Name of the node or, if the name is not in the database, the physical (MAC) address of the node.
MAC Address	Physical (MAC) address of the node.
Status	Status of the node: <ul style="list-style-type: none"> ◆ On—The node is actively participating in a ring poll. ◆ Off—The node is not participating in a ring poll.
Duration	Time elapsed since the node was On or Off.
UpStream Neighbor	MAC address of the node upstream to this station on the logical ring.
DownStream Neighbor	MAC address of the node downstream to this station on the logical ring.
Last Entered Time	Date and time the node last entered the ring.

Statistic	Explanation
Last Exit Time	Date and time the node last exited the ring.
SMT Request Type	The SMT request to which the node is responding. Indicates if the node was able to successfully respond to the request. In case of a failure, the response code indicates the reason.
SMT Response Type	The SMT response generated by the node on receiving an SMT request. If the node was unable to respond, the response code indicates the reason.
Request Denied	The cumulative total of request denied responses generated by the node. A request denied frame is generated when the responding node does not support the SMT version number of the requesting node, when a set fails, or when a request for synchronous bandwidth allocation by a node cannot be honored.
In CRC Error	Total number of cyclic redundancy check (CRC) line errors reported by this node.
Out CRC Error	Total number of CRC errors reported by the nearest active downstream neighbor of this station and detected by the probe.
Lost Frames	Total number of lost frame errors received on the network. A lost frame error indicates that the end delimiter of a frame was lost in the network.
In Beacons	Total number of beacon frames detected by the probe that named this station as its upstream neighbor.
Out Beacons	Total number of beacon frames sent by this station and detected by the probe.
Insertions	Number of times the probe detected this station inserting onto the ring.

Viewing Statistics of Nodes on a Token Ring Segment

The Token Ring Stations view displays statistics for individual nodes on the monitored token ring segment. The view lists the nodes on the segment and shows the order of each node on the ring and which node is the active monitor.

To view the statistics of nodes on a token ring segment:

- 1 In Novell ConsoleOne, select a token ring segment.
- 2 Click *View > Token Ring Stations*.

The view displays statistical information as described in [Table 29-20](#). Statistics are cumulative since the RMON agent was started and are updated every ten seconds.

Table 29-20 *Statistics of nodes on a Token ring segment*

Statistic	Explanation
Order	Relative position of the node on the token ring from the RMON agent.
Name	Name of the node or, if the name is not in the database, the physical (MAC) address of the node.
MAC Address	Physical (MAC) address of the node.

Statistic	Explanation
Status	Status of the node: <ul style="list-style-type: none"> ◆ On—The node is on the ring. ◆ Off—The node is off the ring. ◆ On (Monitor)—The node is on the ring and is the active monitor.
Duration	How long this node has been on or off.
Last Entered Time	Date and time the node last entered the ring.
Last Exit Time	Date and time the node last exited the ring.
Duplicate Address	Total number of duplicate address errors reported, generated when this node detects other nodes using its own address.
Soft Errors	Number of soft errors in packets transmitted by this node.
Inline Errors	The total number of line errors reported by this station in error reporting packets to the ring error monitor and detected by the probe.
Outline Errors	The total number of line errors reported in error reporting packets sent by the nearest active downstream neighbor of this station and detected by the probe.
Internal Errors	Number of internal errors this node has reported. Internal errors generally indicate a recoverable failure of a network adapter board.
In Burst Errors	The total number of burst errors reported to the Ring error monitor and detected by the probe.
Out Burst Errors	The total number of burst errors reported in error reporting packets sent by the nearest active downstream neighbor of this station and detected by the probe.
AC Errors	Number of times this node could not interpret the Address Recognized Indicator (ARI) and the Frame Copied Indicator (FCI) during the ring process.
Abort Errors	Number of times a node transmitted an abort sequence. Abort sequences are usually transmitted when a node detects an error in frames it is currently transmitting.
Lost Frame Errors	Number of times a node transmitted a frame but failed to receive it back in its entirety.
Congestion Errors	Number of times the node detected a frame addressed to its specific address but could not copy it (generally due to insufficient buffers).
Frame Copied Errors	Number of times a node detected a frame addressed to its specific address with either or both the ARI and FCI bits set to 1. (Indicates that another node is using its address.)
Frequency Errors	Number of times a node's internal clock differed from the ring clock.
Token Errors	Number of token errors. These occur when the token gets corrupted or when the Active Monitor does not see a new frame transmitted in the required amount of time. Only the Active Monitor can report this error.
In Beacon Errors	The total number of beacon frames sent by this station and detected by the probe.
Out Beacon Errors	Total number of beacon frames sent by this station and detected by the probe.
Insertions	Number of times the probe detected this station inserting onto the ring.

Statistic	Explanation
Last NAUN	The station that was last named by the probe as the next active upstream neighbor (NAUN).

Viewing Conversations (Traffic) Between Nodes

Novell ZENworks Server Management provides real-time data about all the network traffic between a selected node and one or more other nodes on a segment. This data can be viewed from the Conversations view. You can use the data displayed in this view to determine specific information about node communication. For example, it can show which nodes communicate with a router or server, determine the load on a server, or examine the traffic flowing to or from a node that is reporting difficulties.

To view conversations between nodes:

- 1 In Novell ConsoleOne, select a node.
- 2 Click *View > Conversations*.

If the selected node is connected to more than one segment, the Select Segment dialog box displays.

- 2a Select the segment where the node you want to examine traffic is connected then click *View*, and then click *Conversations*.

The Conversations view lists the percentage of traffic that each destination node contributes to the load on the source node. However, due to sample skewing (samples not taking place at the same time) and rounding up of statistics, the numbers in the columns do not always add up to 100%.

The statistics displayed in the Conversations view are updated every 5 seconds. [Table 29-21](#) describes the statistics displayed in the Conversations view:

Table 29-21 Statistics displayed in the Conversations view

Statistic	Explanation
Node	Name of the destination nodes with which the source node is communicating
% Pkt Load	Percentage of the packet load between a destination node and the source node
% Byte Load	Percentage of the byte load between a destination node and the source node
Pkts/s In	Packets per second received by a destination node from the source node
Pkts/s Out	Packets per second transmitted by a destination node to the source node
Bytes/s In	Bytes per second received by a destination node from the source node
Bytes/s Out	Bytes per second transmitted by a destination node to the source node
Pkts In	Number of packets received by a destination node from the source node since the view was opened
Pkts Out	Number of packets transmitted by a destination node to the source node since the view was opened
KBytes In	Total kilobytes received by a destination node from the source node since the view was opened

Statistic	Explanation
KBytes Out	Total kilobytes transmitted by a destination node to the source node since the view was opened
Protocols	Protocol packet types used by the destination node in this conversation
First Transmit	Date and time that the destination node first transmitted on the network since the traffic analysis agent was loaded
Last Transmit	Date and time that the destination node last transmitted since the traffic analysis agent was loaded
MAC Address	Physical (MAC) address of the destination node

Monitoring Nodes for Inactivity

For segments on which at least one Traffic Analysis Agent for NetWare version 1.0 or later is installed, you can specify the nodes on the segment you want to monitor so that you are alerted if they become inactive. You can do this using the Monitor Nodes for Inactivity view.

Monitoring nodes for inactivity has the following advantages:

- ◆ You can monitor any node on the segment, regardless of the protocol the node uses.
- ◆ This feature does not impact network traffic because the traffic analysis agent does not poll the nodes to obtain their status.

To view a list of nodes monitored for inactivity:

- 1 In ConsoleOne, select a segment.
- 2 Click *View > Monitor Nodes for Inactivity*.

Another way to monitor connectivity is to specify the target in the Ping window and test the status of the specified node. The Connectivity Test window displays statistics that enable you to determine the status of the specified target. For details, see [Chapter 28, “Monitoring Services,” on page 1025](#).

By default, the poll interval for refreshing the Monitor Nodes for Inactivity view is zero seconds. You can configure the poll interval based on how often you want the view to be refreshed. For details, see [“Specifying the Poll Interval for Refreshing the Monitor Nodes for Inactivity View” on page 1092](#). You can also change the duration for the agent to verify the node before declaring it inactive. For details, see [“Specifying the Duration for the Agent to Determine if a Node Is Inactive” on page 1092](#).

IMPORTANT: You do not need to keep the Monitor Nodes for Inactivity view open or Novell ConsoleOne for the nodes to be monitored because the RMON agent is doing the monitoring, not Novell ConsoleOne. The Alarm Manager must be running to record an inactive node in the Alarm Report. If Novell ConsoleOne is not running, check for alarms after you restart it.

To monitor a node for inactivity:

- 1 In ConsoleOne, right-click a node or from any view that displays a list of nodes, then click *Monitor Nodes for Inactivity > Add*.

To disable a node from being monitored for inactivity:

- 1 In ConsoleOne, right-click the node that is monitored for inactivity then click *Monitor Nodes for Inactivity*, and then click *Delete*.

IMPORTANT: After the addition of any inactive node, if the NIC card of the node is changed, you will be able to see the node in the Monitor Node for Inactivity view but will not be able to delete it because of the change of MAC address.

Statistics displayed in the Monitor Nodes for Inactivity view are described in [Table 29-22](#):

Table 29-22 *Inactivity Statistics for the Monitor Nodes*

Statistic	Explanation
Name	Displays a list of nodes that are being monitored for inactivity
MAC Address	Displays the MAC address of the network interface
Status	Displays the status of a node as active or inactive

You can open the Monitor Nodes for Inactivity view to check the Status column any time Novell ConsoleOne is running. To do this, complete the following steps:

- 1 In ConsoleOne, select a segment.
- 2 Click *View > Monitor Nodes for Inactivity*.

The Status column displays if the selected node is active or inactive.

This Monitoring Nodes for Inactivity feature also allows you to add and monitor the nodes from the segments. To do this, follow these steps:

- 1 In ConsoleOne, right-click the segment, and select *Monitor Nodes For Inactivity view*.
- 2 Click  or select *File > Actions > Add Node(s)*.
- 3 In the Monitor Nodes for Inactivity - Add Node dialog box, select the nodes you want to add.

The nodes you add will be displayed in the view.

The Monitor Nodes for Inactivity module now sends alarms if the node you are monitoring is in the Off state or Timeout state. You can also change the timeout value from the Monitor Nodes for Inactivity view.

- 1 Click  or select *File > Actions > Edit Timeout*.

- 2 Specify the timeout period.
- 3 Click *OK*.

29.4.3 Capturing Packets

Novell ZENworks Server Management provides packet capture and decoding tools that help you analyze your network activity and identify the source of network problems. Capturing and decoding packets can help you troubleshoot network problems by giving you detailed information about what is actually happening on a segment.

Novell ConsoleOne can request packet capture on any monitored segment. Each RMON agent captures packets on the segment it monitors and stores information in its local buffer.

The following sections contain detailed information about capturing packets:

- ♦ “Defining a Capture Filter” on page 1066
- ♦ “Starting Packet Capture” on page 1068
- ♦ “Creating Simultaneous Packet Capture” on page 1068
- ♦ “Stopping Packet Capture” on page 1068
- ♦ “Restarting a Stopped Packet Capture” on page 1069
- ♦ “Saving and Viewing the Captured Packets” on page 1069

Defining a Capture Filter

Novell ZENworks Server Management provides a capture filter with default values you can use to capture packets using any Traffic Analysis agent. You can modify the values by defining a filter. For example, if you want to capture only NetWare packets sent by a certain node, you can define a filter to capture only those packets. As a result, the buffer has more space to store your selected packets. Once you define a filter setting it shall be saved for future uses.

When you specify a capture filter, you are specifying the packets to capture (include) in the buffer on the RMON agent, not the packets to exclude. When you specify both a node and a protocol, packets must meet both criteria to be captured. If you select more than one protocol family, packets can meet either protocol criteria to be captured.

To define a capture filter:

- 1 Click *File > Actions > Capture Packets*.
- 2 In the *Capture Name* text box, enter a name if you do not want to use the default name.
The capture name helps you keep track of multiple captures on the same segment.
- 3 In the *Capture Using* drop-down list, select the Traffic Analysis Agent that will be used to capture packets. Click *Find In Atlas* to select any Traffic Analysis Agent on the site. The Traffic Analysis Agent you have selected will be saved and used the next time.
- 4 Enter or select the source and destination nodes from the *Stations* box. You can also click the *Find Node* icon to select the node from the Find dialog box, an atlas component.
The *Stations* box displays a list of nodes on the segment from which the user can capture packets. You can select from Hardware, IP, or IPX stations.
If you choose ANY in both the source and destination node list, all packets sent by or received from any node are captured.
- 5 Select the direction of traffic flow between the nodes.
Click an arrow option from the drop-down list to specify the direction of the traffic flow. The available node and traffic flow directions are shown in the following table.

Node	Arrow	Node	Effect
node1	<==>	node2	Capture packets that node1 sends to node2 and packets that node2 sends to node1.
node1	<==>	ANY	Capture packets that node1 sends to any node and packets that node1 receives from any node. This is equivalent to ANY <==> node1.
ANY	<==>	ANY	Capture all packets sent by or received from any node.
node1	==>	node2	Capture packets that node1 sends to node2. This is equivalent to node2 <== node1.
node1	==>	ANY	Capture packets that node1 sends to any other node. This is equivalent to ANY <== node1.
node1	<==	node2	Capture packets that node2 sends to node1. This is equivalent to node2 ==> node1.
node1	<==	ANY	Capture packets that any node sends to node1. This is equivalent to ANY<== node1.

- 6** If you want to filter on protocols used, add the protocol suites you want to the *Selected* list box. To add a protocol to the *Selected* list box, select it from the *Available* list box > click *Add*.

or

To delete a protocol from the *Selected* list box, select it then click *Remove*.

All protocols are selected by default when you first use Novell ZENworks Server Management. If no protocols are listed in the *Selected* list box, all protocols are captured.

See [“Protocol Decodes Suite Supported by Novell ZENworks Server Management” on page 1044](#) for details about the protocol decoding support that Novell ZENworks Server Management provides.

- 7** Specify what kind of packets to capture on Ethernet, FDDI, or token ring segments.

The default statistics for the segments are listed in the following table.

Segment Type	Available Statistics	Default Statistics
Ethernet	Only good packets, only error packets, or both good and error packets.	Good packets and error packets
FDDI ring	All packets, LLC packets, MAC packets, or SMT packets.	All packets
Token ring	All packets, non-MAC packets, or MAC packets. MAC packets are used to manage the operation of the token ring.	All packets

- 8** Specify whether to stop packet capture or to overwrite the oldest packets in the buffer with newer ones when the buffer is full.

Continuing packet capture means that a stop criteria does not exist and new packets will overwrite those already captured. You will need to manually stop packet capture if you select to overwrite the oldest packets.

- 9** Specify a buffer size.

Select a buffer size from the drop-down list or specify the size you want. The default buffer size is 128 KB.

The RMON agent will attempt to provide the buffer size requested. If not enough space is available in server memory for a large buffer, the RMON agent cannot create the requested size.

10 Select a slice size.

A slice specifies the maximum number of bytes of each packet, counting from the packet header, to keep in the buffer. This helps maximize the number of packets you can store in your buffer space, as well as reduce the load on the RMON agent to process captured packets. If you want to decode protocol header information, you need only 100 to 150 bytes. The rest is typically data that you need only if you suspect a data corruption problem. However, on certain very large packets, slicing can cause incorrect decodes by truncating information.

Your capture filter is now set up. If you decide not to capture packets, click the Cancel button.

Starting Packet Capture

To start packet capture:

- 1 Define a capture filter. See [“Defining a Capture Filter” on page 1066](#) for the procedure.
- 2 Click *OK* to apply the filter settings on the preferred RMON agent of the segment.
- 3 Click *Start* in the Capture Status dialog box.

When you start packet capture, the Start button in the Capture Status dialog box toggles to read Stop and the activity indicator reflects the capture buffer storage as it progresses. As packets that meet the filter criteria are captured, the capture buffer will begin to store the packet data, and a box below it will display the number of packets captured. The needle stops turning when the capture buffer is full.

Creating Simultaneous Packet Capture

You can create simultaneous packet captures by repeating the procedure you followed to start the first capture. This lets you set up and run captures with different capture criteria.

You can run a maximum of 20 packet captures with different capture criteria.

Stopping Packet Capture

When you set up a capture filter, you choose whether to stop packet capture when the capture buffer is full or to continue to capture packets but overwrite the oldest packets in the buffer.

By default, the packet capture will stop when the capture buffer is full. If you select to overwrite when the buffer is full, you must stop packet capture manually.

To stop packet capture manually, click the *Close* button in the Capture Status dialog box.

IMPORTANT: If you restart packet capture from the Packet Capture Setup window, the existing buffer is deleted and refreshed.

Restarting a Stopped Packet Capture

When the Packet Capture Setup window is open, you can start and stop capturing packets using the *Start/Stop* toggle button in the Capture Status dialog box. If Novell ZENworks Server Management is capturing packets, the button is labeled *Stop*; if it is not capturing packets, the button is labeled *Restart*. The RMON agent buffer is cleared when you restart.

Saving and Viewing the Captured Packets

You can save captured packets to a file and view as many files as you want, either while you are viewing a capture buffer or independently.

To view the saved packet capture files:

- 1 Click *Tools > View Packet File*.
The File Open dialog box is displayed.
- 2 Browse and select the packet capture file.
The `.tr1` file extension will be appended automatically.

29.4.4 Displaying Captured Packets

You can display and view decoded packets stored in the capture buffer from the Trace Display window by clicking the *View* button in the Capture Status dialog box. If you display this window while packets are being captured, capture automatically stops.

Novell ZENworks Server Management retrieves packet data from the RMON agent only as necessary for Novell ConsoleOne to decode and display the packets as you view them. This minimizes the amount of packet data transferred between the RMON agent and Novell ZENworks Server Management. If you prefer not to display all the packets you captured, you can create a display filter to display only a defined group of captured packets. For details, see [“Defining the Display Filter” on page 1072](#).

The following sections provide information on how you can view captured packets and perform trace display operations:

- ◆ [“Viewing Captured Packets” on page 1070](#)
- ◆ [“Filtering Packets for Display” on page 1072](#)
- ◆ [“Defining the Display Filter” on page 1072](#)
- ◆ [“Selecting and Decoding a Different Packet” on page 1074](#)
- ◆ [“Highlighting Protocol Fields and Hexadecimal Bytes” on page 1074](#)
- ◆ [“Saving Packet Files” on page 1075](#)
- ◆ [“Opening Packet Files” on page 1075](#)
- ◆ [“Printing Packets” on page 1075](#)

Novell ZENworks Server Management provides default settings based on which captured packets are displayed in the Trace Display window. To change the default values provided for displaying captured packet, see [“Choosing Options to Display a Captured Packet” on page 1088](#).

Viewing Captured Packets

You can use the Trace Display view to view the decoded packet capture information, the packet data in hexadecimal format, and a summary of the captured packets:

To view a captured packet:

- 1 In Novell ConsoleOne, select a node or a segment.
- 2 Click *File > Actions > Capture Packet*.
- 3 Capture packets using the capture filter of your choice. See [“Defining a Capture Filter” on page 1066](#) for details.
- 4 Click the *View* button in the Capture Status dialog box.

The Trace Display window contains three panes that display captured and decoded packets, as described in the following sections:

- ♦ [“Viewing the Packet Decode” on page 1070](#)
- ♦ [“Viewing Packet Data in Hexadecimal Format” on page 1070](#)
- ♦ [“Viewing a Summary of Captured Packets” on page 1071](#)

When you view packets initially, the first packet in the Summary pane is highlighted and selected. The contents of that packet are displayed in the Decode pane. If you select a different packet in the Summary pane, it is highlighted and the Decode pane displays its decoded contents.

You can change the size of the Trace Display panes by dragging the divider between windows.

Viewing the Packet Decode

The Decode pane displays detailed information about the contents of a selected packet. The packet contents are interpreted (decoded) and displayed by protocol fields.

By default, the Decode pane displays fully decoded packet data. You can configure the Trace Display window to display the decoded packets either as full protocol decodes or by one line per protocol layer. See [“Choosing Options to Display a Captured Packet” on page 1088](#) for details about how to change the default settings.

Viewing Packet Data in Hexadecimal Format

The Hexadecimal pane shows uninterpreted packet data in hexadecimal format. The ASCII or EBCDIC portion of the Hexadecimal pane (to the right) displays a dot for every hexadecimal byte that has no ASCII or EBCDIC equivalent.

The first column in the pane indicates the offset in hexadecimal bytes. The offset is the number of bytes counting from the beginning of the header. For example, the first three lines have the following offset:

- ♦ Hexadecimal 0—indicates zero offset
- ♦ Hexadecimal 10—indicates decimal 16 offset (16 bytes precede this)
- ♦ Hexadecimal 20—indicates decimal 32 offset (32 bytes precede this)

Regardless of whether you choose to display one-line decoded or fully decoded packets in the Decode pane, entire packets are displayed in the Hexadecimal pane. The Hexadecimal pane and the highlighting tool are especially helpful with the full-decode display when you are trying to associate protocol fields with specific bytes in a packet. For details, see [“Highlighting Protocol Fields and Hexadecimal Bytes” on page 1074](#).

Viewing a Summary of Captured Packets

The Summary pane gives you an overview of the conversation between the source and the destination nodes. You can select a packet in this pane for further decoding and display in the other panes. You can scroll the pane horizontally, and you can change the size and position of the columns in the pane.

Statistical information about the captured packets displayed by the Summary pane is described in [Table 29-23](#):

Table 29-23 *Statistical information of the captured packets as displayed by the Summary pane*

Statistic	Explanation
No.	Numbers the packets in order of arrival at the traffic analysis agent.
Source	IP address, IPX address, or the physical (MAC) address of the node that sent the packet. Names are stored in the database. If no name is found in the database, the MAC address is displayed.
Destination	Node to which the packet was sent. The node is displayed as the IP address, IPX address, or the physical (MAC) address of the node.
Layer	Abbreviation of the highest protocol layer in the packet. It might display NCP for NetWare Core Protocol™ (NCP™) software, ether for the Ethernet data link layer, RTMP for the AppleTalk Routing Table Maintenance Protocol layer, or 802.2 for the IEEE 802.2 Logical Link Control layer. If you choose the full decode option, the Decode pane displays the full name of the protocol layer and all its fields. The Hexadecimal pane shows the entire packet.
Summary	Brief description of the contents of the highest protocol layer.
Error	Type of errors, if any, in the packet. This column is displayed only for Ethernet media.
Size	Number of bytes in the packet. Packet size always excludes the packet preamble and the CRC.
Absolute Time	Clock time on your computer when the packet arrived.
Interpacket Time	Time elapsed from the end of the preceding packet to the end of the current packet.
Relative Time	Time that elapsed since the arrival of the first packet still in the buffer.

Filtering Packets for Display

After you have captured packets, you can apply a display filter to the capture buffer and view only the packets that interest you. You can filter on node names or addresses, protocol families or protocol layers, or contents of a selected field. This is useful in situations when, after you have captured packets, you realize there is a problem with a specific workstation and you want to display only the packets it has sent or received.

Display filtering requires the transfer of a portion of every captured packet from the RMON agent to Novell ConsoleOne. For large captures, this consumes time and network bandwidth. We recommend that you define very specific capture filters rather than filtering during display. However, subsequent filtering of the same capture does not result in additional data transfer from the traffic analysis agent because the data is already transferred to Novell ConsoleOne. Therefore, it is much quicker to filter the same packet capture a second time.

Display filters affect only the display; they do not change the capture buffer. All captured packets remain in the capture buffer and are available for viewing with a different display filter or without any display filter.

You can define a display filter in either of two ways:

- ♦ From the Trace Display window, click *View > Filter*.
The Display Filter dialog box is displayed. For details, see [“Defining the Display Filter” on page 1072](#).
- ♦ Double-click a packet in the Summary pane or double-click a selected protocol layer or field in the Decode or Hexadecimal pane.
A filter is set based on what you selected. You can also modify the filter information as needed. For details, see [“Point-and-Click Filtering” on page 1073](#).

Defining the Display Filter

Capture packets using the capture filter of your choice. See [“Defining a Capture Filter” on page 1066](#) for details. To define a display filter:

- 1** In Novell ConsoleOne, select a segment.
- 2** Click *File > Actions > Packet Capture*.
- 3** Click the *View* button in the Capture Status dialog box.
- 4** With the Trace Display window displayed and active, click *View > Filter*.
- 5** Select the nodes from the drop-down lists. You can select from IP, IPX or MAC address.
Alternatively, you can enter a node name or address in place of ANY in either or both of the drop-down list boxes.
- 6** Select the direction of the traffic flow from the arrow options available in the drop-down list.
- 7** To display all the packets of a specific protocol layer:
 - 7a** Double-click a protocol suite name from the list of protocols to display a list of all the protocols in the suite.
 - 7b** Scroll through the list to find the protocol you want.
 - 7c** Select the protocol.

- 8** To display all the packets that have the same contents in a specific field:
- 8a** Enter the offset in hexadecimal bytes.
You can count the offset in the *Hexadecimal* pane when the packet is decoded, using the offset column for guidance. See “[Viewing Packet Data in Hexadecimal Format](#)” on [page 1070](#) for details.
 - 8b** Specify whether the offset is counted from the beginning of the packet or from the beginning of a protocol layer.
If you choose the protocol layer option, you must select a specific protocol in the *Protocol* box.
 - 8c** Enter the data that you want to include in the filter.
 - 8d** Specify the format in which you want the data to be displayed. Select from hexadecimal, ASCII, or EBCDIC format options.
You can also fill in the values using point-and-click filtering. See “[Point-and-Click Filtering](#)” on [page 1073](#).
- 9** Click *OK*.
- The dialog box closes and Novell ZENworks Server Management begins to select the required packets from the capture buffer.
- If you have a large capture buffer, Novell ZENworks Server Management displays the initial packets that pass the filter. Novell ZENworks Server Management continues to filter in the background while you examine these packets.
- The Summary pane shows the list of filtered packets that met the criteria in the display filter. You can view and decode them as described earlier in this section.

Point-and-Click Filtering

You can define a display filter using the point-and-click method by double-clicking a field in the Trace Display window.

To define a display filter using the point-and-click method:

- 1** To display only packets in one conversation (for example, between a node and a server), double-click a packet in that conversation in the Summary pane.
The Display Filter dialog box displays the source and destination of the selected packet. You can also modify the addresses, if needed. For example, you can change the destination address to ANY, the broadcast address, or a specific node address.
or
To display all the packets containing a specific protocol layer, double-click the protocol line in the *Decode* pane.
The Display Filter dialog box displays the protocol you selected.
or
To display all packets with the same contents as a specific field, double-click the field in the *Decode* pane.
The Display Filter dialog box displays the field, data, and type of data for the selected field.
or

To display all packets with the same content as a specific offset, click the field in the *Hexadecimal* pane.

The Display Filter dialog box displays the offset and the type of data for the selected field.

2 Click *OK*.

The dialog box closes and Novell ZENworks Server Management begins to select the packets from the capture buffer.

The Summary pane displays the list of packets that met the display filter criteria.

Selecting and Decoding a Different Packet

To select a different packet for decoding:

1 Select *View > Go To*.

You can also use the arrow keys on your keyboard to highlight a different packet.

2 Enter the packet number.

If the packet number specified is more than the total number of captured packets, an error message displays. If a display filter is set and the specified packet number has not passed the filter, then a packet closest to the specified packet is displayed.

Packets are retrieved from the RMON agent as you select their headers in the Summary pane using the mouse or the arrow keys. Using the Go To dialog box avoids transferring unwanted packet data from the RMON agent. Similarly, scrolling the Summary pane with the scroll button retrieves only the packet header data when creating the decode summary, whereas using the arrow keys retrieves all packet data.

Highlighting Protocol Fields and Hexadecimal Bytes

Novell ZENworks Server Management provides a highlighting tool that helps you associate protocol fields and hexadecimal bytes. Highlighting can be a useful training tool for new network managers who want to learn about protocol decoding.

You can use this tool in the following ways:

- ♦ Highlight a protocol layer in the Decode pane.

All bytes are highlighted in the selected protocol layer of the Hexadecimal pane.

- ♦ Click a field in any of the protocol layers in the Decode pane.

Associated bytes are highlighted in the Hexadecimal pane.

- ♦ Click hexadecimal bytes in the Hexadecimal pane.

All hexadecimal and ASCII or EBCDIC bytes of this field in the Hexadecimal pane are highlighted, and the associated field is highlighted in the Decode pane.

- ♦ Click ASCII or EBCDIC text in the Hexadecimal pane.

All hexadecimal and ASCII or EBCDIC bytes that belong to the field are highlighted in the Hexadecimal pane, and the associated field is highlighted in the Decode pane.

Saving Packet Files

You can save captured packets to a file and open the file later to analyze or print. When you save packets to a file, Novell ZENworks Server Management creates a binary file with the name you specify. You might want to save packets to a file in the following situations:

- ♦ To transfer the packets to another system or to send them for analysis.
- ♦ To apply a display filter to decoded captured packets so you can view only the packets that interest you. After you apply the display filter, you can save the filtered packets to a file.
- ♦ To compare packets saved from your buffer with other packets. You can either save the other packets, or view them from the capture buffer. You can view only one active capture buffer at a time. However, after you have saved packets to a file, you can open as many files as you want, and simultaneously view a capture buffer, if desired.

Packet files are compatible with the Traffic Analysis Agent for Windows and earlier versions of ManageWise®. Hence, packets captured and saved using Traffic Analysis Agent for Windows can be viewed using Novell ZENworks Server Management.

To save captured packets to a file while viewing the capture buffer:

- 1 Click *File > Save As*.

The Save Filtered Packets or Save Unfiltered Packets dialog box is displayed, depending on whether you filtered your packets.

- 2 Enter the name in the *Filename* option.

The `.tr1` file extension is appended automatically.

- 3 Click *OK*.

IMPORTANT: Filter out the captured packets you want to save. (See “[Filtering Packets for Display](#)” on page 1072.) When you save packets, you save only those that pass the display filter. If you did not filter the display, all packets are saved.

Opening Packet Files

To open a packet file:

- 1 From the main menu of Novell ConsoleOne, click *Tools > View Packet File*.
- 2 Double-click the file you want to open.

Printing Packets

To print packets:

- 1 Open a Trace Display window, either by capturing packets or by opening a packet file.
- 2 Click *File > Print*.
- 3 Select the print options you want.

You can select the destination, format, and the packets you want to print.

- ♦ Choose whether to print to your default printer or to a file. If you choose a file, enter its name and specify whether the current packet data should overwrite the file or be appended to it.

- ♦ Choose whether you want a summary of the packet information, only the hexadecimal information, a full decode, or a brief decode. These formats correspond to the three panes described in [“Viewing Captured Packets” on page 1070](#).
- ♦ Choose whether to print all packets, a range of packets, or only the filtered packets.

4 Click *OK*.

29.4.5 Analyzing Traffic Generated by Protocols in Your Network

Novell ZENworks Server Management lets you determine the distribution of protocols in your network and provides statistical information of the protocols discovered by the RMON2 agent in the network, as well as transport and application layers. You can also add supported and custom protocols to your network. Supported protocols are those that the RMON2 agent is able to decode and count the number of packets transmitted in your network using the protocol. Custom protocols are not supported by the RMON2 agent but are used by nodes in your network.

The following sections explain how you can use Novell ZENworks Server Management to manage protocols in your network:

- ♦ [“Displaying a List of Protocols Used in Your Network” on page 1076](#)
- ♦ [“Determining the Distribution of Protocols in a Segment” on page 1078](#)

Displaying a List of Protocols Used in Your Network

You can use the Protocol Directory property page to view a hierarchical representation of supported and custom protocols used in the network, transport, and application layers in your network. By default, the page displays the Protocol Directory Tree that displays a collapsed list of protocols. The protocols used in the data link layer are displayed at the top level. You can expand each protocol to display the list of supported and custom protocols under the selected protocol.

You can also use the Protocol Directory property page to add or delete the protocols supported by the RMON2 agent. For details, see [“Adding Supported Protocols to the Protocol Directory Tree” on page 1077](#). The custom protocols that are used by the nodes in your network but are not supported by the RMON2 agent can also be added using the limited extensibility feature of RMON2. For details, see [“Adding Custom Protocols to a Supported Protocol Tree” on page 1078](#). For details about the limited extensibility feature, see [RFC 2021 \(http://www.isi.edu/in-notes/rfc2021.txt\)](http://www.isi.edu/in-notes/rfc2021.txt).

For a selected protocol, you can specify the RMON2 groups you want the RMON2 agent to support. This will let you obtain the RMON2 details of the groups that you specify the agent to support. While adding the protocol, you can enable the agent support for the Host group, Matrix group, and Address Map group. The *Groups Supported* box in the lower portion of the property page indicates whether the agent support for the Host and Matrix groups in the network layer and application layer, and support for the Address Map group are enabled, disabled, or not supported for the selected protocol. You can configure the values displayed in the *Groups Supported* box.

The *Add* and *Remove* buttons are enabled only when you select a protocol in the Protocol Directory tree.

IMPORTANT: The Traffic Analysis Agent for NetWare and Traffic Analysis Agent for Windows do not support enabling of the Address Map, Host, and Matrix groups for protocols in the Protocol Directory.

To open the Protocol Directory property page:

- 1 In Novell ConsoleOne, click *RMON2* under Service within a node.
- 2 Click *File > Properties > Protocol Directory* tab.

Refer to the following sections:

- ♦ [“Adding Supported Protocols to the Protocol Directory Tree” on page 1077](#)
- ♦ [“Adding Custom Protocols to a Supported Protocol Tree” on page 1078](#)

Adding Supported Protocols to the Protocol Directory Tree

Supported protocols are those that the RMON2 agent is able to decode and count the number of packets transmitted in your network using the protocol.

Default values are provided for the parameters of protocols supported by the RMON2 agent. When you enter the name of a protocol, the default values are displayed if the protocol is supported.

To add a protocol to the Protocol Directory tree:

- 1 Open the Protocol Directory property page.
- 2 Select a protocol from the Protocol Directory tree.
- 3 Click *Add*.

The following table describes the parameters for a selected protocol.

IMPORTANT: The Protocol Name parameter cannot be configured. If you configure the port number or protocol code of a selected protocol, all child protocols of the selected protocol will be deleted.

Parameter	Description
Protocol Name	Displays the name of the protocol.
Protocol ID	Displays the identifier for the protocol. Displays the port number for an application layer protocol or the protocol code for protocols in other layers. The protocol identifier is always a decimal value.
Description	Displays a short description of the selected protocol.
Groups Supported	Displays whether the agent support of the Address Map group, Host group, or Matrix group is enabled for the selected protocol.

If the protocol name you enter or select from the *Protocol Name* list is supported by the RMON2 agent, the default parameters for the protocol are displayed in the appropriate fields of the Add Protocol dialog box. You cannot edit the parameters after you have added, if you do not want to use the default values.

- 4 Click *OK*.

The new protocol is added as a child protocol of the selected protocol. You cannot edit the parameters of the protocol you have added. You would need to delete the protocol and add the protocol again with different parameters.

Adding Custom Protocols to a Supported Protocol Tree

Custom protocols are those that are not supported by the RMON2 agent but are used by nodes in your network. If the RMON2 agent supports the limited extensibility feature of RMON2 for a selected protocol, you can add custom protocols under the selected protocol. See [RFC 2021 \(http://www.isi.edu/in-notes/rfc2021.txt\)](http://www.isi.edu/in-notes/rfc2021.txt) for more information. If the RMON2 agent does not support the limited extensibility feature for a protocol, you cannot add custom protocols under that protocol. A custom protocol cannot have child protocols.

Because default values are not provided for custom protocols, you must enter the appropriate values if you are adding a protocol that is not supported by the RMON2 agent.

To add a custom protocol to the Protocol Directory tree:

- 1 Select a supported protocol from the Protocol Directory tree.
- 2 Click *Add*.
- 3 In the *Protocol Name* field, enter the name of the protocol.
- 4 In the *Protocol ID* field, enter the port number for an application layer protocol or a protocol code for protocols in other layers.

IMPORTANT: The port number or protocol code should be a decimal value.

- 5 From the *Groups Supported* box, select the groups you want the RMON2 agent to support for the protocol.

The custom protocol is added as a child protocol of the supported protocol.

To remove a protocol from the Protocol Directory tree:

- 1 Select a protocol from the Protocol Directory tree.
- 2 Click *Remove*.

IMPORTANT: If you remove a protocol that has child protocols, all the child protocols are also removed from the Protocol Directory tree.

Determining the Distribution of Protocols in a Segment

Novell ZENworks Server Management lets you determine the distribution of protocols discovered by the RMON2 agent. You can use the information displayed in this view to analyze the traffic in your network and to troubleshoot network problems. Use the Protocol Directory property page to add, delete, or edit a protocol. See “[Adding Supported Protocols to the Protocol Directory Tree](#)” on [page 1077](#) and “[Adding Custom Protocols to a Supported Protocol Tree](#)” on [page 1078](#) for details.

The distribution of protocols discovered by the RMON2 agent is displayed in the Protocol Distribution view, based on the layer in which the protocols are discovered.

To view the distribution of protocols in the selected segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Protocol Distribution*.

The view displays the following three tables that list the protocols discovered in the network:

- ♦ Network layer table

- ◆ Transport layer table
- ◆ Application layer table

The protocols discovered by the RMON2 agent are placed in the appropriate table in the Protocol Distribution view depending on the layer in which they were discovered. Each table displays protocol statistics that are updated every 15 seconds.

Table 29-24 describes the protocol statistics displayed in the Protocol Distribution view:

Table 29-24 Protocol statistics displayed in the Protocol Distribution view

Statistic	Description
Protocol Name	The name of the protocol
Packets/s	The average number of packets transmitted per second using the protocol discovered by the agent on the monitored segment
Bytes/s	The average number of bytes transmitted per second using the protocol discovered by the agent discovered on the monitored segment
Packet Rate %	The percentage of packets transmitted using the protocol; this is relative to the total percentage of packets transmitted using all protocols discovered by the agent
Byte Rate %	The percentage of bytes transmitted using the protocol; this is relative to the total percentage of bytes transmitted using all protocols discovered by the agent

IMPORTANT: Only one entry of each protocol is displayed in the Protocol Distribution view. Consolidated statistics are displayed for a supported protocol in more than one protocol suite.

29.4.6 Analyzing Traffic on Switches

Novell ZENworks Server Management provides statistical information about ports in a monitored switch and a list of nodes connected to each port in your switched network. This information is displayed in the Unified Port Traffic view. You can use the view to determine the load on the desktop and workgroup switches in your switched network. When only one node can be connected to each port in a switch, the switch is known as a desktop switch. When one port of a switch is connected to a connecting device to which more than one node is connected, the switch is called a Workgroup switch.

Ports and nodes connected to ports of a switch can be monitored using an embedded RMON agent or external RMON agent. An embedded RMON agent is installed on the port of a switch. An external RMON agent is installed on a node connected to a switch.

The following sections explain how you can obtain information about switch ports and nodes connected to ports in your switched network:

- ◆ [“Viewing Statistics for Ports in a Switch” on page 1080](#)
- ◆ [“Viewing the Summarized Switch Information” on page 1080](#)

Viewing Statistics for Ports in a Switch

You can use the Unified Port Traffic view to obtain statistical information about every switch port in your network. The view also displays a drop-down list of nodes connected to each port. The information displayed in this view is useful if you want to troubleshoot a port.

The Unified Port Traffic view displays a list of nodes connected to ports on the switch and statistics for each port. You can view Ethernet specific statistics for Ethernet ports on a switch. Statistics specific to FDDI and token ring ports are not displayed with this version of Novell ZENworks Server Management, although general port statistics are displayed for all ports on a switch regardless of the media type. You can choose to display all statistics or configure the Unified Port Traffic view to display selected statistics. For details, see [“Choosing Statistics to Display in the Unified Port Traffic View” on page 1087](#).

To display the statistics of ports in a switch:

- 1 In Novell ConsoleOne, select *Switch/Bridge* under *Services* within a switch.
- 2 Click *View > Port Traffic*.

Viewing the Summarized Switch Information

The Switch Summary view provides brief information about a selected switch. You can view static information about a selected switch and information about alarms generated on the switch. You can also determine the packets and broadcasts received by the switch per second.

To view the summarized switch information:

- 1 In Novell ConsoleOne, select *Switch/Bridge* under *Services* within a switch.
- 2 Click *View > Switch Summary*.

The Switch Summary view displays static information about a selected switch, as described in [Table 29-25](#):

Table 29-25 *Switch static information displayed in the Switch Summary view*

Statistic	Explanation
Vendor	Name of the switch vendor
Switch Type	Type of switch: Transparent or Source Route
Number of Ports Active	Number of active ports on the switch
Forwarding Table Overflow Count	Number of times the forwarding table has exceeded its capacity
Up Time	Time since the switch was last rebooted
Number of Ports Present	Number of ports present on the selected switch
Number of MAC Addresses Learned	Number of MAC addresses dynamically discovered by the switch

The Switch Summary view displays information about alarms generated on a selected switch, as described in [Table 29-26](#):

Table 29-26 Information about alarms generated on a selected switch as displayed in the Switch Summary view

Statistic	Explanation
Severity	Severity level attributed to the trap.
From	Network address of the device that sent the alarm to the alarm management system.
Owner	Segment or device affected by the alarm.
Summary	Summary of the event, often including the name or address of the object affected by the alarm.
Received Time	Date and time when the alarm management system received the alarm.
Type	Generic description of the alarm. For example, Volume out of disk space.
Category	Displays the category of the alarm based on the MIB that defines the trap-type objects. The category is directly related to the MIBs included in the management server MIB pool. For example, the category for NetWare servers is based on the NetWare Server Alarm MIB.

The Switch Summary view displays dynamic information about a selected switch, as described in [Table 29-27](#):

Table 29-27 Dynamic information about a selected switch as displayed in the Switch Summary view

Statistics	Explanation
Switch Load (pkts/sec)	The load on the switch based on packets received by the switch per second
Frames Dropped/sec	The number of received packets discarded per minute
Broadcasts/sec	The number of broadcasts received by the switch from the nodes connected to ports of the switch

29.5 Optimizing Traffic Analysis

The tools provided by Novell ZENworks Server Management to analyze your network performance have default settings. You can change the default settings of various views to display only the information you require.

The following sections provide information about how you can configure the Novell ZENworks Server Management tools to suit your networking environment:

- ♦ [Section 29.5.1, “Choosing Options to Display Stations on a Segment,”](#) on page 1082
- ♦ [Section 29.5.2, “Choosing Options to Display Trend Statistics,”](#) on page 1083
- ♦ [Section 29.5.3, “Choosing Options to Display the Top Nodes Graph,”](#) on page 1086

- ◆ [Section 29.5.4, “Choosing Statistics to Display in the Unified Port Traffic View,”](#) on page 1087
- ◆ [Section 29.5.5, “Choosing Options to Display a Captured Packet,”](#) on page 1088
- ◆ [Section 29.5.6, “Configuring Alarm Options from the Set Alarm Dialog Box,”](#) on page 1089
- ◆ [Section 29.5.7, “Configuring the Monitor Nodes for Inactivity View,”](#) on page 1091

29.5.1 Choosing Options to Display Stations on a Segment

You can configure the Stations view to display only the top 20 nodes or all nodes on the monitored segment. You can also choose the statistic based on which you want to display the top 20 nodes.

The following configuring options are available:

- ◆ [“Displaying Statistics for All Nodes on a Segment”](#) on page 1082
- ◆ [“Displaying Statistics for the Top 20 Nodes on a Segment”](#) on page 1082
- ◆ [“Choosing a Statistic Based on Which Top 20 Nodes Are Displayed”](#) on page 1082

Displaying Statistics for All Nodes on a Segment

To display statistics for all nodes on a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Stations*.
To display all nodes on a segment, more time is required and more network traffic is generated.
- 3 From the Stations view, click *View > Show All Stations*.

Displaying Statistics for the Top 20 Nodes on a Segment

To display statistics for the top 20 nodes on a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *View > Stations*.
- 3 From the Stations view, click *View > Show Top N Stations*.

Choosing a Statistic Based on Which Top 20 Nodes Are Displayed

Packets out per second is the default statistic based on which top 20 nodes are displayed in the Stations view.

To choose a different statistic based on which you want the top 20 nodes to be displayed, do either of the following:

- 1 From the Stations view, click *View*, select *Show Top N Stations*, then choose a statistic from the list of statistics displayed.
- 2 Click the *Top Nodes Statistics* drop-down box in the toolbar of the *Stations* view, then choose a statistic from those displayed.

The available statistics are described in [Table 29-28](#):

Table 29-28 *Top Nodes Statistics*

Statistic	Explanation
Packets/s In	Packets per second received by a node
Packets/s Out	Packets per second transmitted by a node
Bytes/s In	Bytes per second received by a node
Bytes/s Out	Bytes per second transmitted by a node
Errors/s	Errors per second transmitted by a node
Broadcasts/s	Broadcast packets per second transmitted by a node
Multicasts/s	Multicast packets per second transmitted by a node (packets transmitted to a specific group of nodes)

If you close the Stations view after changing the default settings, you will be prompted to save the changes made to the default settings. If you want the Stations view to be displayed based on the statistic you chose, you can save the setting. The next time you open Novell ConsoleOne and launch the Stations view, you will be able to view the nodes on the monitored segment based on the statistic you specified.

29.5.2 Choosing Options to Display Trend Statistics

You can change the default settings based on which the segment performance trends are displayed in the Segment Trends view.

The following configuration options are available:

- ♦ [“Choosing Statistics Based on Which Trend is Displayed” on page 1083](#)
- ♦ [“Setting the Time-Scale Options” on page 1086](#)

Choosing Statistics Based on Which Trend is Displayed

To change the statistics based on which segment performance trend is displayed:

- 1 Click the *Profile* button in the Segment Trends view.
- 2 Select a profile from the *Select Profile* list.

The default profile will display a trend with statistical information of total packets, good packets, and error packets on the monitored segment.

If you choose not to use the profiles listed in the *Select Profile* list, you can select the required statistics from the *Select Statistics* list.

The statistics list lets you examine the Ethernet, FDDI, and token ring statistics described in [Table 29-29](#):

Table 29-29 *Ethernet, FDDI, and token ring statistics*

Statistic	Media Support	Explanation
Abort Delimiter Errors/s	Token ring	Average number of abort delimiter errors observed per second. This error indicates that a node aborts a transmission.
AC Errors/s	Token ring	Average number of AC errors observed per second. This error is reported when an intended recipient of a packet fails to mark it as received or flags an error on it.
Beacons	FDDI and token ring	Average number of beacons per second observed in the sampling interval. A station transmits these packets when it detects a hard failure upstream.
Broadcast Packets/s	Ethernet, FDDI, token ring	Number of broadcast packets per second.
Burst Errors/s	Token ring	Average number of burst errors observed per second. This error indicates that a node detects the absence of transitions for the required time.
Claim Tokens/s	FDDI ring	Average number of times that the ring enters the claim token state from the normal ring state or ring purge state per second.
CRC/Alignment Errors/s	Ethernet and FDDI ring	Number of cyclic redundancy check (CRC)/alignment errors per second.
Echo Pkts/s	FDDI ring	Average number of echo frames received on the network per second.
Elasticity Buffer Errors/s	FDDI ring	Average number of elasticity buffer overflow errors reported by this station per second. This is due to the difference in the clock frequency between the transmitting and receiving stations.
Error Packets/s	Ethernet	Number of error packets per second.
Fragments/s	Ethernet	Number of fragments per second.
Frame Copied Errors/s	FDDI ring	Average number of frame copied error frames reported per second by the station.
Frequency Errors/s	Token ring	Average number of frequency errors observed per second. This error indicates that a token ring clock on a node differs too much from the clock on the active monitor.
Good Packets/s	Ethernet	Number of good packets per second.
Internal Errors/s	Token ring	Average number of internal errors observed per second. These errors generally indicate a network board failure.
Jabbers/s	Ethernet	Number of jabbers per second.

Statistic	Media Support	Explanation
Line Errors/s	Token ring	Average number of line errors observed per second. These packets are of valid size but have a faulty Frame Check Sequence (FCS) and do not end on an 8-bit boundary.
Lost Frames/s	FDDI and token ring	Average number of lost frame errors on the network observed per second.
Monitor Contentions/s	Token ring	Average number of monitor contentions observed per second; these packets are transmitted by all active nodes when no active monitor is detected on the ring.
Multicast Packets/s	Ethernet, FDDI, and token ring	Number of multicast packets per second.
Oversize Packets/s	Ethernet	Number of oversize packets per second.
Packets	FDDI and token ring	Average number of packets observed per second in the sampling interval.
Receive Congestion Errors/s	Token ring	Average number of receive congestion errors observed per second. This error indicates that a node recognizes a frame addressed to its address, but has no available buffer space.
Ring Wraps/s	FDDI ring	Average number of times a wraparound condition has been detected at this interface per second. This entry does not indicate the number of times the ring has actually wrapped around. It only indicates the number of times the ring has wrapped around this physical path.
Token Errors/s	Token ring	Average number of token errors observed per second. This error indicates that a token is corrupted or the active monitor did not see a new frame in the required amount of time.
Total Bytes/s	Ethernet	Average number of total bytes per second.
Total Packets/s	Ethernet	Average number of total packets per second.
Undersize Packets/s	Ethernet	Number of undersize packets per second.
Unicast Packets/s	Ethernet	Number of unicast packets per second.
Utilization%	Ethernet, FDDI, and token ring	Percentage of maximum network capacity used by all packets in the sampling interval.

If you close the Segment Trends view after changing the default statistics based on which trend is displayed, you will be prompted to save the changes made to the default settings. If you want the segment performance trend to be displayed based on the profile or statistics you chose, you can save the settings that you define. The next time you open Novell ConsoleOne and launch the Segment Trends view, you will be able to view the trend based on the profile or statistics you defined.

Setting the Time-Scale Options

The segment performance trend is updated once every minute. You can set a different time scale based on which you want to update a graph. Select from the following time-scale options:

- ◆ Real Time
- ◆ One Hour
- ◆ One Day
- ◆ One Week
- ◆ One Month
- ◆ One Year

TIP: If you close the Segment Trends view after changing the default time-scale option based on which trend is displayed, you will be prompted to save the changes made to the default settings. If you do not want the trend to be updated in real time, you can save the time-scale setting you choose. The next time you open Novell ConsoleOne and launch the Segment Trends view, the trend will be updated based on the time-scale option you selected.

29.5.3 Choosing Options to Display the Top Nodes Graph

You can configure the Segment Dashboard view to display or disable the top nodes graph. For details, see [“Viewing the Graph of the Top Nodes on a Monitored Segment” on page 1053](#). The top nodes graph is displayed in the lower portion of the Segment Dashboard view. Packets out per second is the default statistic based on which the graph is displayed. You can choose a different statistic based on which you want the graph to be displayed.

The following configuring options are available:

- ◆ [“Displaying the Top Nodes Graph in the Segment Dashboard View” on page 1086](#)
- ◆ [“Choosing the Statistic Based on Which Top Nodes Graph Is Displayed” on page 1086](#)
- ◆ [“Disabling the Top Nodes Graph in the Segment Dashboard View” on page 1087](#)

Displaying the Top Nodes Graph in the Segment Dashboard View

To display the top nodes graph in the Segment Dashboard view:

- 1 From the Segment Dashboard view, click *View > Show Top N Graph*.

Choosing the Statistic Based on Which Top Nodes Graph Is Displayed

To display the top nodes graph based on a different statistic, do either of the following from the Segment Dashboard view:

- 1 Click *View > Show Top N Graph*, then choose a statistic.
- 2 Click the *Top Nodes Statistics* drop-down box in the toolbar of the *Segment Dashboard* view > select a statistic.

The statistics are described in [Table 29-39](#):

Table 29-30 *Top Nodes Statistics*

Statistic	Explanation
Broadcasts/min	Broadcast packets per minute transmitted by a node
Bytes/s in	Bytes per second received by a node
Bytes/s out	Bytes per second transmitted by a node
Errors/min	Errors per minute transmitted by a node
Packets/s in	Packets per second received by a node
Packets/s out	Packets per second transmitted by a node
Multicasts/min	Multicast packets per minute transmitted by a node

IMPORTANT: Errors per minute, broadcasts per minute, and multicasts per minute are updated every 60 seconds rather than every 5 seconds.

Disabling the Top Nodes Graph in the Segment Dashboard View

To disable the top nodes graph in the Segment Dashboard view:

- 1 From the Segment Dashboard view, click *View > Disable Top N Graph*.

29.5.4 Choosing Statistics to Display in the Unified Port Traffic View

Novell ZENworks Server Management provides statistics for each port on the switch. You can view port statistics and a list of nodes connected to each port using the Unified Port Traffic view. You can view Ethernet-specific statistics for Ethernet ports on a switch. Although statistics specific to FDDI and token ring ports will not be displayed with this version of Novell ZENworks Server Management, general port statistics are displayed for all ports on a switch regardless of the media type. For details, see “[Viewing Statistics for Ports in a Switch](#)” on page 1080. You can choose to display only the selected statistics in the Unified Port Traffic view.

To select statistics to be displayed in the Unified Port Traffic view:

- 1 From the Unified Port Traffic view, click *View > Settings*.
- 2 Click the statistics from the *Available Columns* list > click *Add*.

Table 29-31 describes the general port statistics displayed for a port, regardless of the media type of the port:

Table 29-31 *General port statistics displayed for a port*

Statistic	Explanation
Frames In/sec	Number of frames received by the port per second.
Frames Out/sec	Number of frames sent by port per second.

Statistic	Explanation
Port Link Status	Displays if the port is active or inactive. If the port is active, it can transmit and receive packets.
Speed	The speed at which packets are transmitted or received by the port.
Media Type	Media type of the selected port.
Local Traffic	Rate of traffic going towards nodes on the same port.

Table 29-32 describes the Ethernet-specific statistics displayed for an Ethernet port in addition to the general port statistics listed above:

Table 29-32 *Ethernet-specific statistics displayed for an Ethernet port*

Statistic	Explanation
Collisions/sec	Number of collisions per second
Utilization	Percentage of maximum network capacity currently consumed by packet traffic on the port
Broadcasts/sec	Number of broadcast packets per second currently received and sent by the port
Multicasts/sec	Multicast packets per second received and sent by the port
Packets/sec	Number of packets per second received and sent by the port
CRC Align Error	Total number of line errors reported by the port
Oversize Pkts	Number of oversize packets received and sent by the port

29.5.5 Choosing Options to Display a Captured Packet

Novell ZENworks Server Management provides default settings to display a captured packet in the Trace Display window.

To change the default settings and display the trace differently:

- 1 Open the Trace Display window.
- 2 From the Trace Display menu, click *View > Options*.
- 3 Select how you want to display the decoded packet.
 - ◆ Full Protocol Decode: Provides information about each field in each protocol layer in a selected packet. This is the default decoding.
 - ◆ One Line Per Protocol Layer: Provides a line of information for each protocol layer of a selected packet.
- 4 Select the level at which you want to display the initial highlight position.
 - ◆ At Highest Protocol Layer: Places the initial highlighting at the highest protocol layer in a packet. This is the default.
 - ◆ At Packet Header: Places the initial highlighting at the packet header.

- 5 Select the format in which you want to display the decoded packet.
 - ♦ ASCII: Displays the hex data in ASCII format. This is the default.
 - ♦ EBCDIC: Displays the hex data in EBCDIC format.

29.5.6 Configuring Alarm Options from the Set Alarm Dialog Box

Novell ZENworks Server Management provides default alarm threshold values for a segment. You can set threshold values for various error conditions on Ethernet, FDDI, and token ring segments to eliminate the need to constantly monitor the segments.

When a segment alarm is enabled, the RMON agent monitors the segment based on the alarm threshold settings. If the configured threshold value is exceeded, the RMON agent sends a trap to the management server, which forwards it to Novell ConsoleOne.

You should change the default values for alarm thresholds as appropriate for your organization. You can determine the appropriate value by observing average and peak traffic levels on your network using the Segment Trends view. For details, see [“Analyzing Trend Data for a Segment” on page 1053](#). You can do this as a part of creating a baseline of typical segment activity on your network.

To set an alarm threshold for a segment:

- 1 In Novell ConsoleOne, select a segment.
- 2 Click *File > Properties > the Segment Alarms* tab.
- 3 Select a segment statistic > click *Edit*.
- 4 Click *Enable* to enable the alarms set for the monitored segment.

When you click *Enable*, the text fields and the *Default* button will be enabled. However, if the default threshold values are not found, the *Default* button will not be enabled.

- 5 Enter the threshold value.
- 6 Specify the sampling time interval.

The RMON agent uses the sampling time interval to average the statistic to determine whether the alarm threshold was exceeded.

TIP: You can also use the Segment Dashboard view to define alarm threshold values for segment statistics. For details, see [“Defining Alarm Thresholds for Statistics Displayed in the Segment Dashboard View” on page 1053](#).

[Table 29-33](#) describes the alarm statistics that Novell ZENworks Server Management tracks for Ethernet, FDDI, and token ring segments:

Table 29-33 Alarm statistics used by ZENworks Server Management to track for Ethernet, FDDI, and token ring segments

Statistic	Media Support	Explanation
Abort Errors	Token ring	Average number of abort errors observed per second in the sampling interval. These errors resemble line errors, but occur in the middle of a transmission.
AC Errors	Token ring	Average number of Address Recognition (and Frame Copied) errors observed per second in the sampling interval. This error is reported when an intended recipient of a packet fails to mark it as received or flags an error on it.
Beacons	FDDI and token ring	Average number of beacons per second observed in the sampling interval. A station transmits these packets when it detects a hard failure upstream.
Broadcasts	Ethernet, FDDI, and token ring	Average number of packets per second sent to the broadcast address FF-FF-FF-FF-FF-FF. Broadcast messages typically consist of general requests for information or transmission of status information to all stations.
Burst Errors	Token ring	Average number of burst errors observed per second in the sampling interval. A burst error is caused by a lack of signal transitions between stations for a short period of time.
Claim Tokens	FDDI ring	Average number of times that the ring enters the claim token state from the normal ring state or ring purge state per second.
Congestion Errors	Token ring	Average number of congestion errors observed per second in the sampling interval. The receiving station runs out of buffer space to store the packet.
CRC Errors	Ethernet and FDDI ring	Average number of CRC errors observed per second in the sampling interval. These packets are of valid size but have a faulty FCS.
Echo Pkts	FDDI ring	Average number of echo frames received on the network per second.
Elasticity Buffer Errors/s	FDDI ring	Average number of elasticity buffer overflow errors reported per second by this station. This is due to the difference in the clock frequency of the transmitting and receiving stations.
Fragments	Ethernet	Average number of fragments observed per second in the sampling interval. Fragments are packets that contain fewer than 64 bytes and have a faulty FCS. They are typically a result of collisions.
Frame Copied Errors	FDDI and Token ring	Average number of frame copied errors observed per second in the sampling interval. This error indicates that a station has detected that another station accepted a packet addressed to the first station.
Frequency Errors	Token ring	Average number of frequency errors observed per second in the sampling interval. This error indicates that a token ring clock on a station differs from the clock on the active monitor.
Internal Errors	Token ring	Average number of internal errors observed per second in the sampling interval. These errors generally indicate a network adapter board failure.

Statistic	Media Support	Explanation
Jabbers	Ethernet	Average number of jabber packets observed per second in the sampling interval. A jabber consists of packets that contain more than 1518 bytes and have a faulty FCS.
Line Errors	Token ring	Average number of line errors observed per second in the sampling interval. These packets are of legal size but have a faulty FCS and do not end on an 8-bit boundary.
Lost Frames	FDDI and token ring	Total number of lost frame errors received on the network. A lost frame error indicates that the end delimiter of a frame is lost in the network.
Monitor Contentions	Token ring	Average number of monitor contentions observed per second in the sampling interval. These packets are transmitted when no active monitor is detected on the ring.
Multicasts	Ethernet, FDDI, and token ring	Average number of packets per second sent to multicast addresses.
Oversize	Ethernet	Average number of oversized packets observed per second in the sampling interval. Oversized packets contain more than 1518 bytes, including the FCS.
Packets	Ethernet, FDDI, and token ring	Total number of packets observed per second in the sampling interval.
Ring Wraps/s	FDDI ring	Average number of times a wraparound condition has been detected at this interface per second. This entry does not indicate the number of times that the ring has actually wrapped around. It only indicates the number of times the ring has wrapped around this physical path.
Token Errors	Token ring	Average number of token errors observed per second in the sampling interval. This error indicates that a token is corrupted or the active monitor did not detect a new frame transmitted during the current sampling interval.
Undersize	Ethernet	Average number of undersized packets observed per second in the sampling interval. Undersized errors are shorter than 64 bytes.
Utilization(%)	Ethernet, FDDI, and token ring	Percentage of maximum network capacity used by all packets in the sampling interval.

When you have set the appropriate threshold values for the segments in your network, you can use the Save As Default button on the Segment Alarms property page to save the values you defined as the default values. However, the default threshold values provided by Novell ZENworks Server Management will not be available after you apply the new values.

29.5.7 Configuring the Monitor Nodes for Inactivity View

By default, the poll interval for refreshing the Monitor Nodes for Inactivity view is zero seconds. You can configure the poll interval based on which you want the view to be refreshed. The agent monitoring nodes on a monitored segment declares a node as inactive after verifying it for a specified period of time. You can change the time duration for the agent to verify the node before declaring it inactive.

The following configuring options are available:

- ♦ “Specifying the Poll Interval for Refreshing the Monitor Nodes for Inactivity View” on page 1092
- ♦ “Specifying the Duration for the Agent to Determine if a Node Is Inactive” on page 1092

Specifying the Poll Interval for Refreshing the Monitor Nodes for Inactivity View

You can modify the `PollInterval` parameter in the `lsmparameters.properties` file to specify the poll interval for refreshing the Monitor Nodes for Inactivity view.

To specify a poll interval for refreshing the Monitor Nodes for Inactivity view:

- 1 Open the `lsmparameters.properties` file located in the `operating_system_drive\install\novell consoleone\bin` directory.
- 2 Specify a value for the `PollInterval` parameter.

The `PollInterval` value should be a positive value, in seconds. The default value is zero (0) seconds.

Specifying the Duration for the Agent to Determine if a Node Is Inactive

When a selected node becomes inactive, the agent monitoring the node verifies the state of the node for one minute before declaring it inactive. You can modify the `HostTimeOut` parameter in the `lsmparameters.properties` file to change the duration for the agent to verify the selected node before declaring it inactive. The agent verifies the inactive node for the specified period of time before declaring it inactive.

To change the duration for the agent to verify a node before declaring it inactive:

- 1 Open the `lsmparameters.properties` file located in the `operating_system_drive\install\novell consoleone\bin` directory.
- 2 Specify a value for the `HostTimeOut` parameter.

The `HostTimeOut` value should be a positive value, in minutes. The default value is one (1) minute.

29.6 Understanding the Traffic Analysis Agents

Traffic Analysis agents enable you to monitor a heterogeneous LAN environment comprised of Ethernet, FDDI, and token ring segments from the easy-to-use Novell ZENworks Server Management interface.

Traffic Analysis agents are RMON agents that can run on a NetWare server, Windows server, or a Windows workstation. They implement a set of functionality defined by the RMON MIB ([RFC 1757](http://www.isi.edu/in-notes/rfc1757.txt) (<http://www.isi.edu/in-notes/rfc1757.txt>)). These agents collect information about activity on your network and make it available to Novell ConsoleOne via SNMP.

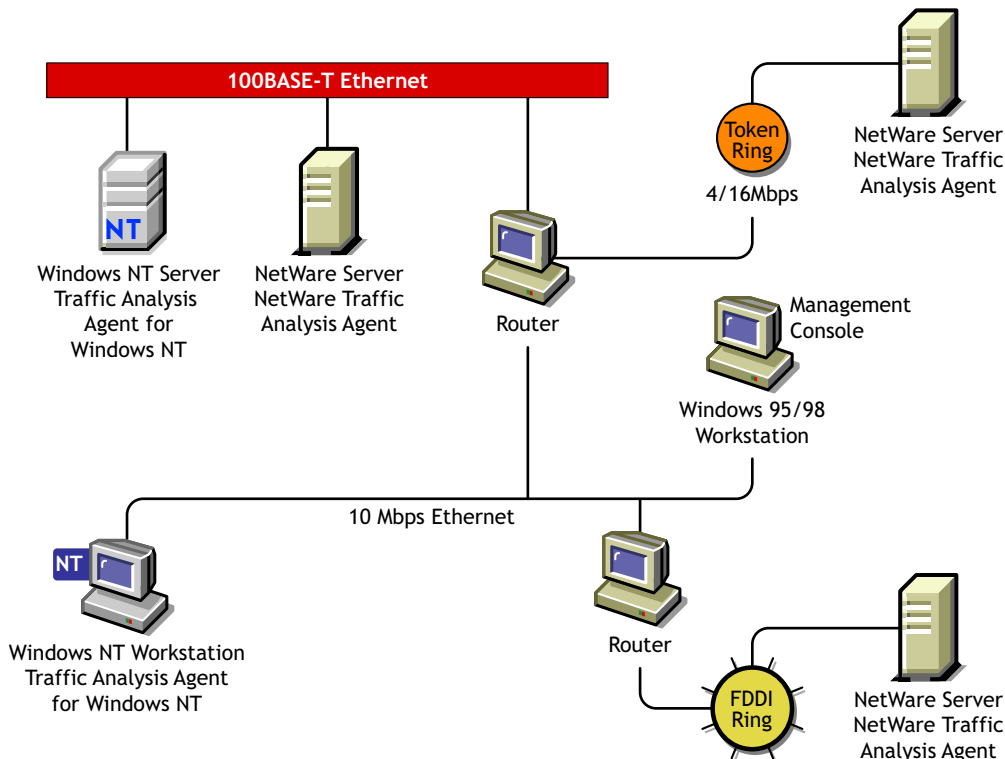

The following functionality is provided by the Traffic Analysis Agents:

- ♦ Monitor the performance of segments and provide vital network statistical information to Novell ConsoleOne
- ♦ Make it easy to set alarm thresholds for proactive network management

- ◆ Capture all packets or selected packets to help you diagnose and resolve problems on the monitored networks
- ◆ Monitor multiple network segments including the Symmetric Multi-Processing (SMP) architecture
- ◆ Monitor network segments for problems, such as high network utilization and communication errors
- ◆ Track dynamic IP address assignments from the DHCP server to the nodes on the network
- ◆ Store data to display real-time trends (hourly) and historical trends (daily, weekly, monthly, and yearly) for statistics such as Total Bytes, Total Packets, Good Packets, Error Packets, and so forth
- ◆ Monitor nodes for inactivity, so that you are alerted if the monitored nodes becomes inactive

Figure 29-7 illustrates the functionality of traffic analysis agents:

Figure 29-7 Traffic Analysis Agents

Novell ZENworks Server Management includes the following traffic analysis agents:

- ◆ Traffic Analysis Agent for NetWare.
For details, see [Section 29.7, “Using the Traffic Analysis Agent for NetWare,”](#) on page 1094.
- ◆ Traffic Analysis Agent for Windows.
For details, see [Section 29.8, “Using the Traffic Analysis Agent for Windows,”](#) on page 1109.

The Novell ZENworks Server Management traffic analysis agents are RMON Plus agents. For details, see [“Functionality of RMON Plus Agents”](#) on page 1037. These agents also implement the first two RMON2 groups. The first RMON2 group is the Protocol Directory group, which provides

a table of protocols for which the agent will monitor and maintain statistics. The second RMON2 group is the Protocol Distribution group, which provides a table of statistics for each protocol in the directory. For details, see “[Functionality of RMON2 Agents](#)” on page 1039.

29.7 Using the Traffic Analysis Agent for NetWare

The Traffic Analysis Agent for NetWare (NLA 1.30) runs on a NetWare server. It is a set of NLM programs that enable NetWare to monitor traffic on Ethernet, FDDI, or token ring segments.

The Traffic Analysis Agent for NetWare implements token ring extensions for the RMON MIB ([RFC 1513](http://www.isi.edu/in-notes/rfc1513.txt)) for token ring media, and a Novell proprietary MIB for FDDI media, in addition to implementing an RMON ([RFC 1757](http://www.isi.edu/in-notes/rfc1757.txt)) for Ethernet media. The Traffic Analysis Agent for NetWare also implements the first two groups for RMON2 ([RFC 2021](http://www.isi.edu/in-notes/rfc2021.txt))

Figure 29-8 illustrates a functional view of the Traffic Analysis Agent for NetWare:

Figure 29-8 Traffic analysis agent for NetWare

The following sections provide information about optimizing and using the Traffic Analysis Agent for NetWare:

- ♦ [Section 29.7.1, “Planning to Install the Traffic Analysis Agent for NetWare,”](#) on page 1095
- ♦ [Section 29.7.2, “Optimizing the Traffic Analysis Agent for NetWare Performance,”](#) on page 1095
- ♦ [Section 29.7.3, “Using the Console Utility of the Traffic Analysis Agent for NetWare,”](#) on page 1103

29.7.1 Planning to Install the Traffic Analysis Agent for NetWare

To successfully install the Traffic Analysis Agent for NetWare on a NetWare server, the server must meet the system requirements specified in “[Management and Monitoring Services Installation](#)” in the *Novell ZENworks 7 Server Management Installation Guide*.

You should configure NetWare SNMP parameters as explained in [Chapter 34, “Using SNMP Community Strings,”](#) on page 1165. This will ensure a smooth installation of the Traffic Analysis Agent for NetWare on the server.

NOTE: Although it is not required, it is recommended that you uninstall previous versions of the Traffic Analysis Agent (referred to as the Traffic Analysis Agent in Novell ZENworks Server Management). If you do not uninstall the previous version of the agent, you must verify that the upgraded NetWare servers run the new Traffic Analysis Agent.

29.7.2 Optimizing the Traffic Analysis Agent for NetWare Performance

The measures described in the following sections can improve the performance of your Traffic Analysis Agent for NetWare servers.

You can configure the Traffic Analysis Agent for NetWare functions described in the following sections by setting the parameters in the `lanz.ncf` file.

- ♦ [“Contents of the LANZ.NCF File”](#) on page 1095
- ♦ [“Modifying the LANZ.NCF File”](#) on page 1099

Contents of the LANZ.NCF File

The `lanz.ncf` file loads all the NLM software required for the Traffic Analysis Agent for NetWare operation. The `lanz.ncf` file resides in the `sys:\zfs_agnt\lanz` directory.

The following example displays the complete text of the default `lanz.ncf` file.

```
#
# Novell NetWare Traffic Analysis Agent
# Version 1.3
#
# - - - - -
# LANZ.NCF: Novell NetWare Traffic Analysis Agent Load File
#
# This NCF file is created by the Novell NetWare Traffic Analysis Agent install
program.
# It is used to load the Novell NetWare Loadable Module files that make up
Novell NetWare
# Traffic Analysis Agent.
```

```

# WARNING:  You should not modify this file unless you need to change one of
# the configuration parameters documented below.  Other changes to this
# file are not recommended.  Should you damage this file, you must reinstall
# Novell NetWare Traffic Analysis Agent.
#
# NOTE:      To enable or disable the monitoring of network adapters by
# Novell NetWare Traffic Analysis Agent, use the LANZCON utility as described
# in the
# Novell NetWare Traffic Analysis Agent Installation and Administration guide.
#
# - - - - -
# Load Parameter Descriptions
#
# load LANZSU debug=1
#
# debug=1    Turns on the LANZ Control screen to see the transactional
# messages from the Novell NetWare Traffic Analysis Agent.
#
# load LANZMEM bound=KB age=HHH
#
# bound=KB   This is the upper limit on memory that can be allocated
# dynamically by the Novell NetWare Traffic Analysis Agent.
#
# Increasing this number allows you to create larger packet
# capture buffers and maintain data for inactive stations
# for a longer period of time.
#
# Decreasing this value reduces the amount of memory that
# can be used by Novell NetWare Traffic Analysis Agent.  This leaves more
# memory for the other server tasks.
#
# Novell NetWare Traffic Analysis Agent automatically purges data for
# inactive stations as the memory boundary is approached.
# This allows Novell NetWare Traffic Analysis Agent to adjust to

```

```
#
# the memory that is available to it dynamically.
#
# If the boundary is low, purging occurs frequently, saving
# only data for stations that have been recently active on
# the network. If this happens, a message appears on the
# system console indicating that not enough memory has been
# allocated to Novell NetWare Traffic Analysis Agent.
#
# KB is the memory boundary in kilobytes.
#
# Initial value: Set by the installation program
# based on memory usage
#
# Minimum recommended value:      512
#
# Maximum recommended value:      75% of free server memory
# when NLM files are loaded
#
# Default value:                   If bound=KB is not specified,
# it defaults to 3072.
#
# age=HHH   Novell NetWare Traffic Analysis Agent purges data for stations
that have
# not been active on the network recently. This parameter
# controls how long data for inactive stations is maintained.
#
# Memory that is used by the station table is not available
# for other uses, such as capturing packets. Reducing the
# AGE value tends to increase the amount of memory
# available for capturing packets.
#
# If you cannot allocate capture buffers that are large,
# you may need to reduce the AGE value.
```

```
#  
# HHH is the inactivity period, in hours, before station data  
# is purged.  
#  
# Minimum recommended value:      1  
#  
# Default value:                    If age=HHH is not specified,  
# it defaults to 168 (1 week)  
#  
# load LANZDI level=1  
#  
# level=1    It indicates that the LANZDI will stop receiving packets  
# when CPU utilization gets high.  
#  
# Default is OFF. LANZDI will continue to receive packets even  
# when CPU utilization gets high.  
#  
# load LANZSM topn=N  
#  
# topn=N    The number of concurrent sorts of top N nodes that  
#  
# Novell NetWare Traffic Analysis Agent supports for each network adapter.  
#  
# Recommended value: 4  
# Minimum value:     2  
# Maximum value:     10  
#  
# load LANZTR poll = 1  
#  
# poll=1    Polls token ring source-routed bridges.  
#  
# load LANZCTL trapreg=1  
#
```

```

# trapreg=1 Causes SNMP traps to be sent to management consoles
# advertising themselves on the network, as well as stations
# listed in SYS:\ETC\TRAPTARG.CFG. Omitting this parameter
# or setting it to 0 causes traps to be sent only to those
# stations listed in the SYS:\ETC\TRAPTARG.CFG file.
#
# - - - - -
load gtrend.nlm
load lanzsu.nlm
load lanzmem.nlm bound = 3072 AGE = 168
load lanzlib.nlm
load lanzdi.nlm
load lanzael.nlm
load lanzhis.nlm
load lanzfcb.nlm
load lanzsm.nlm topn = 4
load lanztr.nlm
load lanzfddi.nlm
load lanzctl.nlm trapreg = 1

```

Modifying the LANZ.NCF File

The following sections describe how to modify the parameters of the commands in the `lanz.ncf` file to configure the Traffic Analysis Agent for NetWare functions:

- ◆ “Turning On the LANZ Control Screen” on page 1100
- ◆ “Disabling Packet Capture” on page 1100
- ◆ “Disabling Generation of Duplicate IP Address Alarms” on page 1100
- ◆ “Setting Packet Flow Control” on page 1100
- ◆ “Setting the Upper Limit of Available Memory” on page 1101
- ◆ “Purging Data from Server Memory” on page 1101
- ◆ “Sorting Concurrent Top Stations” on page 1102
- ◆ “Automatically Sending Alarms to the Management Site Server” on page 1102
- ◆ “Polling Source Route Bridges” on page 1102
- ◆ “Activating Changes in the LANZ.NCF File” on page 1103

To make changes in the `lanz.ncf` file and modify the configuration of the Traffic Analysis Agent for NetWare:

- 1 Open the `lanz.ncf` file with a text editor.
- 2 Insert or modify the appropriate parameter as shown and save the file.
- 3 Unload and reload the Traffic Analysis Agent for NetWare, as described in [“Activating Changes in the LANZ.NCF File” on page 1103](#).

Turning On the LANZ Control Screen

The LANZ control screen reports significant events for the Traffic Analysis Agent for NetWare.

To turn on the LANZ control screen, insert the `DEBUG` parameter in the `LOAD LANZSU.NLM` statement, as shown below:

```
LOAD LANZSU.NLM DEBUG=1
```

The default is Off.

Disabling Packet Capture

You might want to disable packet capture to prevent others from observing sensitive data captured in the packets sent on the network segment.

To disable the packet capture, insert a comment mark (`#`) in the `LOAD LANZFCB` statement, as shown below:

```
LOAD LANZFCB.NLM
```

You can also control packet capture during high levels of traffic instead of disabling packet capture entirely. For details, see [“Setting Packet Flow Control” on page 1100](#).

Disabling Generation of Duplicate IP Address Alarms

In the DHCP environment, the IP address is released to the DHCP server when a DHCP client is shut down. During the process of releasing the IP address to the DHCP server, the client sends a `DHCPRELEASE` packet. If this packet does not reach the agent, false duplicate IP address alarms will be generated.

To disable the generation of duplicate IP address alarms, specify zero (0) as the value for the `DUPIP` parameter, as shown below:

```
LOAD LANZSM DUPIP=0
```

If the `DUPIP` parameter contains a non-zero value or if the parameter is not specified, duplicate IP address alarms are generated.

Setting Packet Flow Control

The Traffic Analysis Agent for NetWare typically operates in promiscuous mode, receiving all packets on the network. However, if server utilization is high and performance becomes degraded, you can set the `LEVEL` parameter to 1, which configures the agent to pause when server traffic is high, and then automatically resume operation in promiscuous mode when the traffic level returns to normal.

The default is not to specify the LEVEL parameter at all, which allows continuous operation in promiscuous mode.

To set packet flow control, use the LEVEL parameter setting, as shown below:

```
LOAD LANZDI LEVEL=1
```

Setting the Upper Limit of Available Memory

The BOUND parameter sets the upper limit of available memory that can be allocated dynamically to the Traffic Analysis Agent for NetWare.

The value of the BOUND parameter is measured in kilobytes (KB). The default value is 3072 KB. The minimum recommended value is 512 KB. The maximum recommended value is 75% of the memory that is available after all NLM files are loaded.

You might receive the message “Insufficient memory available for the Traffic Analysis Agent for NetWare” in the following situations:

- ♦ The server has too little memory
- ♦ The server has sufficient memory, but the memory is not available to the Traffic Analysis Agent for NetWare
- ♦ You requested a packet capture buffer that is too large, and the agent granted you less memory than requested

In each case, you should increase the value of the BOUND parameter and add more RAM to your NetWare server.

To change the upper limit of available memory, edit the BOUND parameter, with the appropriate value, as shown below:

```
LOAD LANZMEM BOUND=3072 AGE=168
```

Purging Data from Server Memory

The Traffic Analysis Agent for NetWare holds its data in server memory. You can control the amount of data held in memory by setting the value of the AGE parameter. When data reaches the age specified in the parameter, the data is purged from memory. The AGE parameter is particularly useful on large, bridged networks.

The value of the AGE parameter is measured in hours. The default value is 168, or one week. The minimum recommended value is one hour.

You should lower the AGE parameter if you receive the message “Insufficient memory available for the Traffic Analysis Agent for NetWare” and you have allocated sufficient memory for the agent.

Having insufficient memory is not harmful to the agent or the server. The Traffic Analysis Agent for NetWare can run indefinitely, even when the memory allocated to it is not sufficient.

To modify the amount of data held in server memory, change the value of the AGE parameter, as shown below:

```
LOAD LANZMEM BOUND=3072 AGE=168
```

Sorting Concurrent Top Stations

The Traffic Analysis Agent for NetWare sorts stations whenever the top eight graphs on the Segment Dashboard view, the Stations view, or both are displayed by Novell ConsoleOne. The sorts are independent of each other and can be computed on the basis of different statistics.

Because each of the sort computations uses server CPU cycles, you should limit the number of concurrent computations.

To set the number of concurrent sort computations per network adapter, set the TOPN parameter, as shown below:

```
LOAD LANZSM TOPN=n
```

The default value is 4. The minimum value is 2. The maximum value is 10.

Automatically Sending Alarms to the Management Site Server

The Traffic Analysis Agent for NetWare can automatically send SNMP alarms (sometimes referred to as SNMP traps) to the Management Site Server or other nodes on the network in the following configurations:

- ♦ The Traffic Analysis Agent for NetWare receives the SAP packets sent by the Management Site Server.
- ♦ The Management Site Server or other node is listed in the server's `traptarg.cfg` file. This file can be edited to add other trap targets.

The `traptarg.cfg` file is stored in the `sys:\etc` directory. The file provides instructions for its use. You can edit the file with any ASCII text editor.

To enable alarms to be sent automatically, add the TRAPREG parameter setting, as shown below:

```
LOAD LANZCTL TRAPREG=1
```

The default is 1. If you omit the TRAPREG parameter or set its value to zero (0), the agent sends alarms only to management consoles listed in the `traptarg.cfg` file.

Polling Source Route Bridges

To control source route bridge polling on token ring networks, use the POLL parameter, as shown below:

```
LOAD LANZTR POLL=1
```

1 = On and 0 = Off.

Setting the POLL parameter to 1 polls source routed bridges once every second. You cannot change the polling rate. The default is On.

To turn off this function, set the POLL parameter to zero (0), as shown below:

```
LOAD LANZTR POLL=0
```

The default is to omit the POLL parameter. Also, the LOAD LANZTR statement is commented out on systems that do not have a token ring adapter installed.

Activating Changes in the LANZ.NCF File

To activate the changes you make in the `lanz.ncf` file:

- 1 Save the LANZNCF file.
- 2 Enter `ULANZ` at the server prompt to unload the agent.
- 3 Enter `LANZ` to reload the agent.

29.7.3 Using the Console Utility of the Traffic Analysis Agent for NetWare

The Traffic Analysis Agent for NetWare 1.3 provides a console utility (`lanzcon.nlm`) that performs the following three tasks:

- ♦ Enables or disables network monitoring by the selected network adapters
- ♦ Provides a source of detailed troubleshooting information
- ♦ Resolves a residual entry (for example, a Host TopN entry created by a management console that terminated unexpectedly)

When you install the Traffic Analysis Agent for NetWare, `lanzcon.nlm` is installed automatically in the `sys:\zfs_agnt\lanz` directory.

The following topics are discussed in greater detail in this section:

- ♦ [“Loading the Console Utility of the Traffic Analysis Agent for NetWare” on page 1103](#)
- ♦ [“Enabling or Disabling Network Adapter Monitoring” on page 1104](#)
- ♦ [“Viewing Network Adapter Information” on page 1104](#)
- ♦ [“Viewing the Agent Item Status” on page 1105](#)
- ♦ [“Accessing Detailed Information About Each Item” on page 1105](#)
- ♦ [“Migrating Trend Files” on page 1108](#)

Loading the Console Utility of the Traffic Analysis Agent for NetWare

To use `lanzcon.nlm`, enter the following command at the NetWare console prompt:

```
LOAD LANZCON CONTROLCOMMUNITY = <control community string>
```

IMPORTANT: If LANZCON is launched without any command line argument, then the default control community string is PUBLIC.

`lanzcon.nlm` is loaded and displays a list of network adapters, along with summary information about the network adapters currently installed on the server.

The following information is displayed for each network adapter:

- ♦ **Number (#):** The network adapter entry number in the network interface table.
- ♦ **Description:** A brief description of the network adapter.
- ♦ **Media Type:** The type of network connected to the network adapter: Ethernet, FDDI, or token ring.

- ♦ **Adapter Address:** The physical address of the network adapter.

Enabling or Disabling Network Adapter Monitoring

To enable or disable monitoring of a selected network adapter:

- 1 From the Network Adapters screen, select the appropriate adapter then press F3.
 - ♦ If the selected adapter is currently monitoring an Ethernet or token ring network, the console displays the Adapter Is Monitoring screen.
 - ♦ If the selected adapter is not monitoring an Ethernet or token ring network, the console displays the Adapter Is Not Monitoring screen.
- 2 Select *Yes* or *No* to enable or disable monitoring.

If you disable monitoring, all LAN analysis data for the selected adapter is deleted.

Using LANZCON, an FDDI adapter cannot be disabled. To disable an FDDI adapter:

- 1 Unload LANZCON, if loaded.
- 2 Unload LANZ, if loaded.
- 3 Open `lanz.ncf` from `sys:\zfs_agnt\lanz` directory for editing.
- 4 Comment the statement `LOAD lanzfddi.nlm` by entering the `#` symbol at the beginning of this statement.
- 5 Save `lanz.ncf` and exit.
- 6 Reload LANZ.

Viewing Network Adapter Information

To bring up detailed information for network adapter items:

- 1 From the Network Adapters screen, select an adapter then press Enter.
- 2 From the Select Information to View screen, select Show Adapter Items.

The LANZCON utility displays the Network Adapter Items screen that lists all the items related to the selected network adapter.

The screen for a token ring adapter includes the information from the Novell Token Ring RMON MIB. For details, see [“Viewing the Agent Item Status” on page 1105](#).

To return to the Select Information to View menu, press Esc.

The following information is provided for the selected adapter:

- ♦ **Item:** The types of items that are currently being monitored by the selected adapter. The Network Adapter Items screen shows a set of typical items consisting of token ring, Statistics, History, Host, Matrix, and Host TopN. The Traffic Analysis Agent for NetWare monitors these items by default. In the Network Adapter Items screen, the Host TopN item, indicating the list of the busiest nodes, has been added by a user. You can add other items to this display in Novell ConsoleOne, depending on your configuration.

You can select any item to view more information about each topic. To view the values for the selected item, select the desired item then press Enter. Refer to the following sections for more examples of the screens.

- ♦ **Index:** The entry number of the displayed item in the list of all the items of the same type. The related tables are identified by this index.
- ♦ **Description:** A textual description of the entry. This column indicates the software entity or user that created the item. The items automatically monitored by the Traffic Analysis Agent for NetWare are indicated by the monitor.

For a token ring network entry, this column shows the media speed and the local ring number.

Viewing the Agent Item Status

When you click the *Select Information to View* menu > *Show Agent Items*, LANZCON displays all the items for each network adapter being monitored by the Traffic Analysis Agent for NetWare.

To view the agent item status for the selected agent:

- 1 From the Network Adapters screen, select an adapter then press Enter.
- 2 From the Select Information to View screen, select Show Agent Items.

The All Novell NetWare Traffic Analysis Agent Items screen shows all the items related to the agent monitoring the segment. For example, if you are using multiple adapters to monitor multiple network segments, the screen lists all the items being monitored by the agent.

To delete any entry (except the token ring network entry), select the entry then click *Delete*, and then click *Yes*.

To return to the Network Adapter Items screen, press Esc.

The following information is provided for the agent:

- ♦ **Item:** The types of items available. The All Novell NetWare Traffic Analysis Agent Items screen shows a set of typical items consisting of Statistics, History, Host, Matrix, and Host TopN. Additional items can be displayed, depending on your configuration.

You can select any item for more information about each topic. To view the values for an item, select the desired item then press Enter. See the following sections for more examples of the screens.

- ♦ **Index:** The entry number of the displayed item in the list of all items of the same type. The related tables are identified by this index.
- ♦ **Description:** A textual description of the entry. This column indicates the software entity or user that created the item table. The items automatically monitored by the Traffic Analysis Agent for NetWare are indicated by the monitor.

For a token ring network entry, this column shows the media speed and the local ring number.

Accessing Detailed Information About Each Item

This section describes the major categories of information available for both the selected network adapter and the Traffic Analysis Agent for NetWare. The following topics are covered:

- ♦ [“Viewing the Token Ring RMON MIB Information” on page 1106](#)
- ♦ [“Viewing the FDDI Ring RMON MIB Information” on page 1106](#)
- ♦ [“Viewing Statistics Information” on page 1106](#)
- ♦ [“Viewing History Information” on page 1106](#)

- ♦ “Viewing Host Information” on page 1107
- ♦ “Viewing Matrix Information” on page 1107

Viewing the Token Ring RMON MIB Information

To view the Token Ring RMON MIB information:

- 1 From the Network Adapter Items screen, select the token ring item, then press Enter.
- 2 From the Select Information to View screen, select *Show Adapter Items*, then press Enter.
- 3 Press Esc to exit this screen.

Viewing the FDDI Ring RMON MIB Information

To view the FDDI ring RMON MIB information:

- 1 From the Network Adapter Items screen, select the *FDDI Ring* item, then press Enter.
- 2 From the Select Information to View screen, select *Show Adapter Items*, then press Enter.

Viewing Statistics Information

The statistics information presents the basic statistics for each monitored adapter per segment.

To view the statistics information:

- 1 From the Network Adapter Items screen, select *Statistics*.
- 2 Press Enter.

For an Ethernet network entry, the LANZCON utility displays the Statistics Information screen.

This screen displays the statistical values of the selected network adapter. The display is updated periodically with the latest values for each field.

- 3 To exit this screen, press Esc.

Viewing History Information

The history information defines sampling functions for the networks that are being monitored. The History Control table defines a set of samples at a particular sampling interval for a particular network adapter.

To view the history information:

- 1 From the Network Adapter Items screen, select *History*, then press Enter.
- 2 To exit this screen, press Esc.

The field descriptions are as follows:

- ♦ **Index:** An integer that uniquely identifies a row in the History Control table.
- ♦ **Data Source:** Identifies the network adapter and the Ethernet, FDDI, or token ring segment that is the source of the data for entries defined by this object.
- ♦ **Buckets Requested:** The requested number of discrete sampling intervals over which data will be saved in the portion of the media-specific table associated with this entry.
- ♦ **Buckets Granted:** The actual number of discrete sampling intervals over which data will be saved.

- ♦ **Interval:** The interval, in seconds, over which data is sampled for each bucket. The interval can be set to any number between 1 and 3,600 (one hour). The default interval for past hour is 30 seconds per sample, and the default interval for past day is 30 minutes (or 1,800 seconds) per sample.

The sampling scheme is determined by the buckets granted and the control interval.

- ♦ **Owner:** The entity that created the item. “Monitor” indicates that the item was created by the Traffic Analysis Agent for NetWare.
- ♦ **Status:** A status of Valid indicates that the agent is operating normally under the instructions given by the table.

Viewing Host Information

The host group gathers statistics about specific hosts or nodes on the LAN. The Traffic Analysis Agent for NetWare learns of new nodes on the LAN by observing the source and destination MAC addresses in good packets. For each node known to the agent, a set of statistics is maintained.

To view the host (node) information:

- 1 From the Network Adapter Items screen, select *Host* then press Enter.

The host group consists of three tables: two data tables and one control table. The two data tables are *hostTable* and *hostTimeTable*. The control table, *hostControlTable*, includes the following objects, which correspond to the fields displayed in the Host Information screen:

- ♦ **Index:** An integer that uniquely identifies a row in the *hostControlTable*. Each row in the control table refers to a unique network adapter, and thus, a unique segment.
- ♦ **Data Source:** Identifies the network adapter and the Ethernet, FDDI, or token ring segment that is the source of the data for the entries defined by this object.
- ♦ **Table Size:** The number of rows in the *hostTable* associated with this row.
- ♦ **Last Delete Time:** The value of the *sysUpTime* MIB object that corresponds to the last time an entry was deleted from the portion of the *hostTable* associated with this row. The value is zero (0) if no deletions occurred.
- ♦ **Owner:** Indicates the entity or user that created the item. “Monitor” indicates that the item was created by the Traffic Analysis Agent for NetWare.
- ♦ **Status:** A status of Valid indicates that the agent is operating normally under the instructions given by the table.

Viewing Matrix Information

The matrix group records information about the conversations between pairs of nodes on a network segment. The information is stored in the form of a matrix. This method of organization is useful to retrieve specific pairings of traffic information, such as finding out which nodes are making the most use of a server.

To view the matrix information:

- 1 From the Network Adapter Items screen, select *Matrix*, then press Enter.

The matrix group consists of three tables: two data tables and one control table. The data tables are `matrixSDTable` and `matrixDSTable`. The control table, `matrixControlTable`, includes the following objects, which correspond to the fields displayed in the Matrix Information screen:

- ♦ **Index:** An integer that uniquely identifies a row in the `matrixControlTable`. Each row in the control table defines a function that discovers conversations on a particular network and places statistics about them in the two data tables.
- ♦ **Data Source:** Identifies the network adapter, and the Ethernet, FDDI, or token ring segment that are the source of the data for the entries defined by this object.
- ♦ **Table Size:** The number of rows in the `matrixTable` associated with this row.
- ♦ **Last Delete Time:** The value of the `sysUpTime` object that corresponds to the last time an entry was deleted from the portion of the `matrixTable` associated with this row. The value is zero (0) if no deletions occurred.
- ♦ **Owner:** Indicates the entity or user that created the item. “Monitor” indicates that the item was created by the Traffic Analysis Agent for NetWare.
- ♦ **Status:** A status of Valid indicates that the agent is operating normally under the instructions given by the table.

Migrating Trend Files

In Novell ConsoleOne, you can view trends of traffic patterns on the monitored Ethernet, FDDI, and token ring segments. You can use the trend data to analyze traffic on the segment. For details, see [“Analyzing Trend Data for a Segment” on page 1053](#).

Earlier versions of the Traffic Analysis Agent for NetWare (1.20 and 1.21) collected trend data that was sampled every one minute. The Traffic Analysis Agent for NetWare 1.30 that ships with Novell ZENworks Server Management collects trend data that are sampled every one minute, one hour, and one day. This functionality of version 1.30 of the Traffic Analysis Agent for NetWare ensures minimal communication between the agent and Novell ConsoleOne, to reduce network traffic.

You can use the migrating tool (`gtrend.exe`) to convert the trend data collected by earlier versions of the Traffic Analysis Agent for NetWare to trend data that can be used by version 1.30 of Traffic Analysis Agent for NetWare and Novell ConsoleOne.

To migrate trend files collected by versions 1.20 or 1.21 of the Traffic Analysis Agent for NetWare:

- 1 Copy `gtrend.exe` from the Installation CD to a TEMP folder on a 32-bit Windows machine.
- 2 Copy the trend data files collected by earlier versions of the Traffic Analysis Agent for NetWare to the TEMP folder.
- 3 Run `gtrend.exe`.

This will migrate the existing one-minute trend files to the corresponding one-hour and one-day trend files that can be used by version 1.30 of the Traffic Analysis Agent for NetWare.

- 4 Copy the migrated trend files to the `sys:\gtrend\` folder on the NetWare server and run the version 1.30 of the Traffic Analysis Agent for NetWare on the same server.

NOTE: The migration tool will not migrate older token ring trend data collected by version 1.20 or 1.21 of the Traffic Analysis Agent for NetWare because the older agents implemented a proprietary Token Ring MIB that enabled the agent to collect trend data sampled every one minute. Version 1.3 of the Traffic Analysis Agent for NetWare implements the standard Token Ring MIB that supports historical trends (one minute, one hour and one day).

29.8 Using the Traffic Analysis Agent for Windows

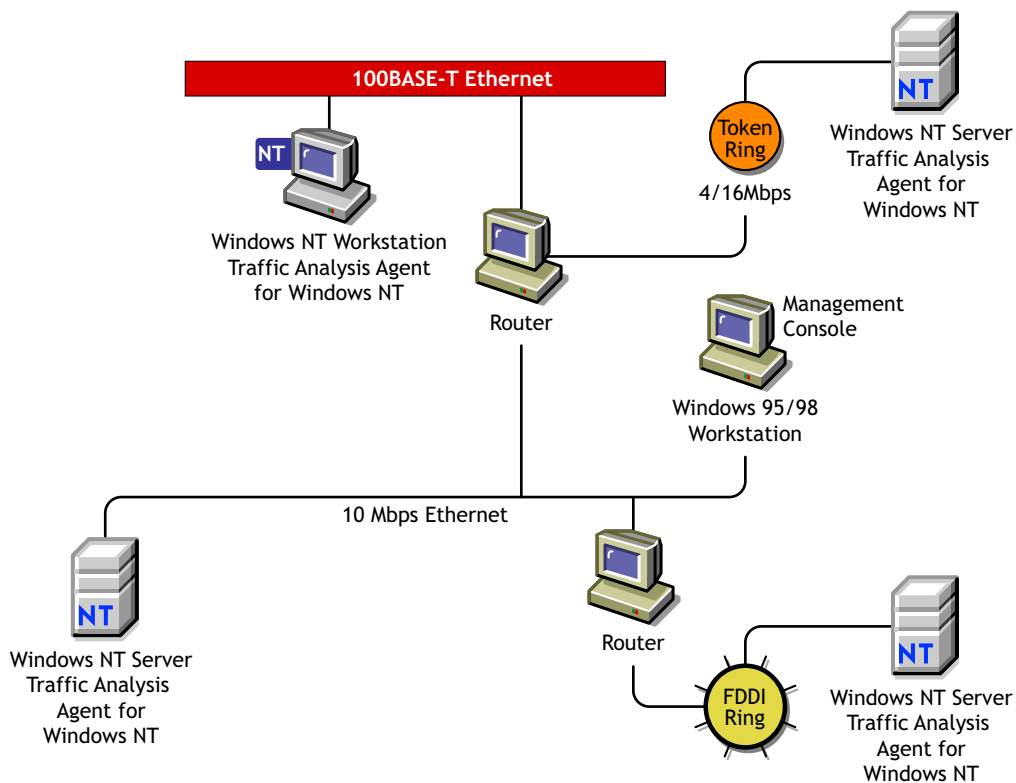

The Traffic Analysis Agent (version 1.30) for Windows runs on a Windows server or on a Windows workstation. The Traffic Analysis Agent for Windows monitors traffic on Ethernet, FDDI, or token ring segments.

The Traffic Analysis Agent for Windows is an RMON agent that implements functionality defined by the RMON MIB. It implements token ring extensions for RMON ([RFC 1513 \(http://www.isi.edu/in-notes/rfc1513.txt\)](http://www.isi.edu/in-notes/rfc1513.txt)) for token ring media, and a Novell proprietary MIB for FDDI media, in addition to implementing an RMON ([RFC 1757 \(http://www.isi.edu/in-notes/rfc1757.txt\)](http://www.isi.edu/in-notes/rfc1757.txt)) for Ethernet media.

The agent collects information about activity on your network and makes it available to Novell ConsoleOne via SNMP. The Traffic Analysis Agent for Windows also implements the first two groups of RMON2 ([RFC 2021 \(http://www.isi.edu/in-notes/rfc2021.txt\)](http://www.isi.edu/in-notes/rfc2021.txt)).

Figure 29-9 illustrates a functional view of the Traffic Analysis Agent for Windows:

Figure 29-9 Traffic Analysis Agent for Windows

The following sections provide information about optimizing and using the Traffic Analysis Agent for Windows:

- ◆ [Section 29.8.1, “Changes Made During Installation,” on page 1110](#)
- ◆ [Section 29.8.2, “Planning to Install the Traffic Analysis Agent for Windows,” on page 1111](#)

- ♦ [Section 29.8.3, “Optimizing the Traffic Analysis Agent for Windows,”](#) on page 1113
- ♦ [Section 29.8.4, “Using LANZCON,”](#) on page 1116

29.8.1 Changes Made During Installation

When you install the Traffic Analysis Agent for Windows, the files listed in [Table 29-34](#) are copied to Windows:

Table 29-34 Files are copied to Windows during the Traffic Analysis Agent for Windows installation

Filename	Location	Description
lanzndis.sys	\winnt\system32\drivers	Kernel mode driver interface
lanzctl.dll	\winnt\system32	Control module
lanzmem.dll	\winnt\system32	Memory manager module
lanzlib.dll	\winnt\system32	Library module
lanzdi.dll	\winnt\system32	User mode driver interface
lanzsm.dll	\winnt\system32	Monitor module
lanzhis.dll	\winnt\system32	History module
lanzael.dll	\winnt\system32	Alarm, event, and log module
lanzfcbl.dll	\winnt\system32	Filter capture, buffer module
lanztr.dll	\winnt\system32	Token ring manager module
lanzfdi.dll	\winnt\system32	FDDI manager module
gtrend.dll	\winnt\system32	Trend module
lanzcon.exe	\lanznt	Agent console application
lanzcon.chm	\lanznt	Agent console help
gtrend.exe	\zfs_agnt\lanzcon	Tool for migration of trend data from the older agent.
mgmtapi.dll	\zfs_agnt\lanzcon	SNMP application file
msvcpl50.dll	\zfs_agnt\lanzcon	MFC APIs required for LANZCON
lanzctl.dll	\zfs_agnt\lanzcon	Required for LANZCON
msflxgrd.ocx	%systemroot%\system32	Enables ActiveX* Controls in LANZCON

IMPORTANT: The default directory location for the LANZCON application is `zfs_agnt\lanzcon`. You can change the location of LANZCON during installation.

29.8.2 Planning to Install the Traffic Analysis Agent for Windows

The Traffic Analysis Agent for Windows requires configuration of the Windows SNMP service before installing the agent.

- ♦ “Installing and Configuring the Windows SNMP Service” on page 1111
- ♦ “Installing and Configuring the Windows 2000 SNMP Service” on page 1112

Installing and Configuring the Windows SNMP Service

Before installing the Novell ZENworks Server Management agent, you must install and configure the Windows SNMP service. This is required to enable communication with the management server.

To install and configure SNMP on Windows:

- 1** Install the SNMP service.
 - 1a** In the Control Panel, select *Network > Services* > click *Add*.
 - 1b** Select *SNMP Service* from the Select Network Service dialog box.
 - 1c** Click *OK*.
 - 1d** Enter the full path to the Windows distribution files.
 - 1e** Click *Continue*.
- 2** To configure SNMP to start automatically:
 - 2a** In the Control Panel, double-click *Services*.
 - 2b** Click *SNMP > Startup*.
 - 2c** In the *Startup Type* options, select *Automatic*.
- 3** To configure the SNMP Trap service to start automatically.:
 - 3a** In the Control Panel, double-click *Services*.
 - 3b** Click *SNMP Trap Service > Startup*.
 - 3c** In the *Startup Type* options, select *Automatic*.
- 4** To specify the trap community name and trap destination address so that the agent sends traps to the management server:
 - 4a** In the Control Panel, double-click *Network*.
 - 4b** Click the *Services* tab, then select *SNMP Service*.
 - 4c** Click *Properties*.
 - 4d** Click the *Traps* tab.
 - 4e** Select a name from the *Community Names* box, then click *Add*.
The *Add* button is disabled if there are no Community Names available.
 - 4f** If the public community name is not present, enter *public*.
 - 4g** Click *Add*.
 - 4h** Use the *Trap Destinations* box to add other DNS names and IP addresses in addition to the loopback IP address for the workstations or servers that should receive traps.
 - 4i** Click *OK*.

- 5** To set the *SNMP security* options trap community name so that SNMP packets from any host are accepted by the agent:
 - 5a** In the Control Panel, double-click *Network*.
 - 5b** Click the *Services* tab, then select *SNMP Service*.
 - 5c** Click *Properties*.
 - 5d** Click the *Security* tab.
 - 5e** In the *Accepted Community Names* box, click *Add*.
 - 5f** In the *Community Name* box, enter `public`.
The *Accepted Community Names* list displays the community names from which Windows will accept requests.
 - 5g** Click *Add*.
 - 5h** Select *Accept SNMP Packets from Any Host*, then click *OK*.

Installing and Configuring the Windows 2000 SNMP Service

Before installing the Novell ZENworks Server Management agent, you must install and configure the Windows 2000 SNMP service. This is required to enable communication with the management server.

To install and configure SNMP on Windows 2000:

- 1** Install the SNMP service.
 - 1a** In the Control Panel, select *Administrative Tools*, then click *Configure Your Server*.
 - 1b** In the *Application Server* option, select *Terminal Services*.
 - 1c** Click *Start*.
 - 1d** In the Windows Components Wizard, double-click *Management and Monitoring Tools*.
 - 1e** Select *Simple Network Management Protocol*.
 - 1f** Click *OK*.
 - 1g** Click *Next*.
SNMP is started automatically after installation.
- 2** Configure the SNMP Trap service to start automatically.
 - 2a** In the Control Panel, select *Administrative Tools > Services*.
 - 2b** Click *SNMP Trap Service > Startup*.
 - 2c** In the *Startup Type* options, select *Automatic*.
- 3** Specify the trap community name and trap destination address so that the agent sends traps to the management server.
 - 3a** In the Control Panel, select *Administrative Tools > Services*.
 - 3b** Double-click *SNMP Service*.
 - 3c** Click *Properties*.
 - 3d** Click the *Traps* tab.
 - 3e** Select a name from the *Community Names* box, then click *Add*.
The *Add* button is disabled if there are no Community Names available.

- 3f If the public community name is not present, enter `public`.
- 3g Click *Add*.
- 3h Use the *Trap Destinations* box to add other DNS names and IP addresses in addition to the loopback IP address for the workstations or servers that should receive traps.
- 3i Click *OK*.
- 4 Set the SNMP security options trap community name so that SNMP packets from any host are accepted by the agent.
 - 4a In the Control Panel, select *Administrative Tools > Services*.
 - 4b Double-click *SNMP Service*.
 - 4c Click *Properties*.
 - 4d Click the *Security* tab.
 - 4e In the *Accepted Community Names* box, click *Add*.
 - 4f Select a name from the *Community Name* box.
The *Accepted Community Names* list displays the community names from which Windows 2000 will accept requests.
 - 4g Click *Add*.
 - 4h Select *Accept SNMP Packets from Any Host > click OK*.

IMPORTANT: After installing the SNMP services, you should re-install the service packs again.

29.8.3 Optimizing the Traffic Analysis Agent for Windows

The Traffic Analysis Agent for Windows parameters are configured for optimal performance on Windows. You can optimize the performance of the agent to suit your networking environment.

This section explains how to optimize the agent and monitor the functionality Traffic Analysis Agent for Windows using the agent console (LANZCON) for Windows. For details, see [“Using LANZCON” on page 1116](#).

The following sections explain the Traffic Analysis Agent for Windows configuration options:

- ♦ [“Configuring the Traffic Analysis Agent for Windows” on page 1113](#)
- ♦ [“Configuring the Modules of the Traffic Analysis Agent for Windows” on page 1114](#)
- ♦ [“Configuring the Parameters of the Traffic Analysis Agent for Windows” on page 1114](#)
- ♦ [“Automatically Loading the Agent with the SNMP Service” on page 1116](#)

Configuring the Traffic Analysis Agent for Windows

The Traffic Analysis Agent for Windows provides default values for modules and parameters. You can change the default values to optimize the performance of the Traffic Analysis Agent for Windows.

You can configure the following modules of the Traffic Analysis Agent for Windows:

- ♦ Packet Capture
- ♦ Station Monitor

- ♦ Token Ring Manager
- ♦ FDDI Manager

For details, see “[Configuring the Modules of the Traffic Analysis Agent for Windows](#)” on page 1114.

You can configure the following parameters of the Traffic Analysis Agent for Windows:

- ♦ Memory Bound
- ♦ Memory Age
- ♦ Top N Station
- ♦ Generate Duplicate IP Address Alarms
- ♦ Trend Files Location

For details, see “[Configuring the Parameters of the Traffic Analysis Agent for Windows](#)” on page 1114.

Configuring the Modules of the Traffic Analysis Agent for Windows

By default, all agent modules are enabled to load. You can choose to disable the modules.

To disable the modules of the Traffic Analysis Agent for Windows:

- 1 From the LANZCON main menu, click *Configure > Traffic Analysis Agent Modules > Disable*.
- 2 Deselect the module you want the agent to monitor.
- 3 Click *OK*.

Configuring the Parameters of the Traffic Analysis Agent for Windows

The Traffic Analysis Agent for Windows modules are loaded with default parameters. You can modify the parameters to optimize the performance of the agent.

[Table 29-35](#) describes the parameters of the Memory Manager module:

Table 29-35 *Parameters of the Memory Manager module*

Parameter	Default Value	Range	Description
Memory Bound	4 MB	1 MB - 10 MB	Sets the upper limit of available memory that can be allocated dynamically to the Traffic Analysis Agent for Windows.
Memory Age	168 hours	1 hour - 720 hours	Controls the duration for which the Traffic Analysis Agent for Windows stores data in memory. When the duration setting is reached, existing data is purged from memory.

To modify the Memory Bound parameter:

- 1 From the LANZCON main menu, click *Configure > Traffic Analysis Agent Parameters*.

- 2 Click the *Memory Manager* tab.
- 3 Move the *Memory Bound* slider to the point you want to set as the memory bound value.

To modify the Memory Age parameter:

- 1 From the *LANZCON* main menu, click *Configure > Traffic Analysis Agent Parameters*.
- 2 Click the *Memory Manager* tab.
- 3 Move the Memory Age slider to the point you want to set as the memory age value.

IMPORTANT: Restart the Traffic Analysis Agent for Windows to ensure that the agent utilizes the changed parameter values. For details, see “[Management and Monitoring Services Installation](#)” in the *Novell ZENworks 7 Server Management Installation Guide*.

Table 29-36 describes the parameters of the Station Monitor module:

Table 29-36 *Parameters of the Station Monitor module*

Parameter	Default Value	Range	Description
TopN Station	4 reports	2 - 10 reports	Controls the number of TopN reports the agent can generate.
Generate Duplicate IP Address Alarms	On	-	Controls the generation of duplicate IP address alarms.

To specify the number of TopN reports you want the agent to generate:

- 1 From the *LANZCON* main menu, click *Configure > Traffic Analysis Agent Parameters*.
- 2 Click the *Station Monitor* tab.
- 3 Select the number of TopN reports.

To stop generation of duplicate IP address alarms:

- 1 From the *LANZCON* main menu, click *Configure > Traffic Analysis Agent Parameters*.
- 2 Click the *Station Monitor* tab.
- 3 Deselect the *Generate Duplicate IP Address Alarms* check box.

Table 29-37 describes the Network Trend parameter:

Table 29-37 *Network Trend parameter*

Parameter	Default Path	Description
Trend Files Location	<i>system root\GTREND</i>	Specifies the directory path and location where trend files (*.GT) are created and updated.

IMPORTANT: If you delete the *.GT file, all the previous trend information will be lost.

To specify a path to a location for storing trend data:

- 1 From the *LANZCON* main menu, click *Configure > Traffic Analysis Agent Parameters*.
- 2 Click the *Network Trends* tab.
- 3 Enter or browse to select the directory path to the location where you want the Traffic Analysis Agent for Windows to store trend data.

Automatically Loading the Agent with the SNMP Service

The Traffic Analysis Agent depends on the Microsoft* SNMP service on Windows. When SNMP starts, it loads agent DLLs in its address space. After the agent is installed, it will be always loaded by the SNMP service, by default, whenever the service starts.

You can enable or disable loading of the agent DLLs with SNMP by checking the desired options in the Novell Traffic Analysis Agent Loading with SNMP dialog box. If you disable the agent, the SNMP service will start normally but the Traffic Analysis Agent will not work. The Traffic Analysis Agent will neither capture packets by placing the NIC cards into the promiscuous mode nor will respond to SNMP requests.

29.8.4 Using LANZCON

This section explains how you can use the LANZCON utility to configure and diagnose the Traffic Analysis Agent for Windows.

LANZCON for Windows is a graphical user interface provided by the Traffic Analysis Agent for Windows to configure the agent modules and parameters and to diagnose the agent. You can use LANZCON to obtain information about network segments monitored by the agent to help you troubleshoot problems.

To open the LANZCON utility, do one of the following:

- ♦ From the Windows *Programs* menu, click *Traffic Analysis Agent for Windows > LANZCON*.
- ♦ Double-click the *LANZCON* icon  on your desktop.

To use LANZCON utility with different SNMP community strings, do the following:

- 1 Go to the `lanzcon` directory.
- 2 Enter the following at the command prompt:

```
LANZCON <community name>
```

IMPORTANT: If you launch LANZCON without using the command line argument, the default community string is PUBLIC.

You can perform the following tasks with LANZCON:

- ♦ [“Viewing Network Adapters” on page 1117](#)
- ♦ [“Enabling or Disabling Network Adapter Monitoring” on page 1117](#)
- ♦ [“Viewing the Agent Log” on page 1118](#)
- ♦ [“Viewing the Agent Status” on page 1118](#)

- ◆ “Viewing RMON Tables” on page 1118
- ◆ “Viewing SNMP Traps” on page 1118

Viewing Network Adapters

On loading LANZCON, you will see the Network Adapters window. The Network Adapters window displays information about monitored adapters in two panes.

Table 29-38 describes the two panes in the Network Adapters window:

Table 29-38 *Panes in the Network Adapters window*

Pane	Displays	Description
Left pane	Adapter Tree view	<p>Displays a list of network adapters discovered by the Traffic Analysis Agent for Windows.</p> <p>The default view displays a collapsed tree. You can expand each network adapter in the tree to view the list of RMON tables for the selected adapter.</p>
Right pane	Table view	<p>Displays details about the object you select in the left pane.</p> <p>If you select an adapter in the left pane, interface table (RFC 1213 (http://www.isi.edu/in-notes/rfc1213.txt)) details such as media type, MAC address, and description of the selected adapter are displayed in the right pane.</p> <p>If you select an RMON table in the left pane, table data is displayed in the right pane.</p>

Enabling or Disabling Network Adapter Monitoring

The Traffic Analysis Agent for Windows collects information about monitored adapters and displays it in the right pane of the Network Adapters window.

By default, adapter monitoring is enabled. LANZCON lets you disable adapter monitoring. If you disable adapter monitoring, the Traffic Analysis Agent for Windows stops collecting data for the adapter and the RMON tables for the adapter will be deleted.

IMPORTANT: You cannot disable monitoring FDDI adapters through LANZCON.

To enable adapter monitoring:

- 1 Select an adapter in the left pane of the Network Adapters window.
- 2 Click *View > NetWork Adapters > Enable*.

To disable adapter monitoring:

- 1 Select an adapter in the left pane of the Network Adapters window.
- 2 Click *View > NetWork Adapters > Disable*.

Viewing the Agent Log

The Traffic Analysis Agent for Windows logs significant events and error messages that occurred during a session.

To view the agent log:

- 1 From the *LANZCON* main menu, click *View > Agent Log*.

Viewing the Agent Status

You can view the status of the agent from the Traffic Analysis Agent Status window. The agent status window indicates whether the agent modules are loaded or not loaded.

To view the agent status:

- 1 From the *LANZCON* main menu, click *View > Agent Status*.

Viewing RMON Tables

RMON tables are listed under each network adapter. You can view the RMON tables by selecting a table in the left pane of the Network Adapters window. RMON table data is displayed in the right pane.

The Network Adapter tree displays the following RMON tables:

- ◆ Statistics
- ◆ History Control
- ◆ History Data
- ◆ Host Control
- ◆ Host Entry
- ◆ Host TopN Control
- ◆ Host TopN Entry
- ◆ Matrix Control
- ◆ Matrix SD Entry
- ◆ Filter, Channel, and Buffer

The Alarm Information tree displays the following RMON tables:

- ◆ Alarm
- ◆ Event
- ◆ Log

Viewing SNMP Traps

The Traffic Analysis Agent for Windows monitors network segments and sends traps to the management server. Novell ConsoleOne displays the alarm when it receives the trap from the management server.

Trap information is displayed in the SNMP Traps window. For each trap, [Table 29-39](#) shows trap data that can be obtained.

Table 29-39 Trap information displayed in the SNMP Traps window

Statistic	Explanation
Receive Time	Displays the time when the trap occurred
Trap Summary	Displays a description of the trap

IMPORTANT: LANZCON will receive trap notifications if you have ensured that Windows SNMP has been configured to send traps to a loopback trap destination address. For details, see [“Planning to Install the Traffic Analysis Agent for Windows”](#) on page 1111.

To view SNMP traps from *LANZCON* main menu, click *View > SNMP Traps*.

Customizing the Agent Configuration

The Novell® ZENworks® Server Management with SNMP agents run on Novell NetWare® and Windows* servers in your network. The agents monitor servers, collecting historical data and dynamic data in response to requests from Novell ConsoleOne®. An administrator at the Novell ZENworks Server Management Novell ConsoleOne can request data simply by clicking a representative icon for any device, operating system, or service discovered on a server.

After the Management Agent for NetWare and the Management Agent for Windows have been installed on your network NetWare and Windows servers, they are ready to operate with the default settings. In most cases, this configuration is sufficient; however, you can customize the agent settings to enhance management functionality.

This appendix contains the following sections:

- ♦ [Section 30.1, “Agent Files,” on page 1121](#)
- ♦ [Section 30.2, “Customizing the Management Agent for NetWare,” on page 1124](#)
- ♦ [Section 30.3, “Customizing the Management Agent for Windows Server,” on page 1126](#)
- ♦ [Section 30.4, “Third-Party Agent Configuration,” on page 1128](#)
- ♦ [Section 30.5, “Advanced Trending Agent,” on page 1129](#)
- ♦ [Section 30.6, “Management and Monitoring Services for Linux,” on page 1135](#)

30.1 Agent Files

The following sections describe the agent files that are installed on each managed server:

- ♦ [Section 30.1.1, “Management Agent for NetWare Files,” on page 1121](#)
- ♦ [Section 30.1.2, “Management Agent for Windows Server Files,” on page 1123](#)

30.1.1 Management Agent for NetWare Files

Table 30-1 describes the Management Agent for Novell NetWare NLM™ files installed on a NetWare server:

Table 30-1 List of Management Agent for Novell NetWare NLM files installed on a NetWare server

Management Agent for NetWare NLM Files	Description
<code>servinst.nlm</code>	Implements the NetWare server MIB (<code>nwserver.mib</code>).
<code>hostmib.nlm</code>	Implements the standard Host Resources MIB [RFC 1514] and Novell® extensions to that MIB (<code>nwhostx.mib</code>).

Management Agent for NetWare NLM Files	Description
<code>ntrend.nlm</code>	Implements the Threshold and Trend MIB (<code>nwtrend.mib</code>). When loaded, <code>ntrend.nlm</code> sets trends and thresholds for each monitored attribute according to the server's configuration. The <code>ntrend.ini</code> file contains configuration parameters for <code>ntrend.nlm</code> .
<code>nwtrap.nlm</code>	Implements the NetWare Server Trap MIB (<code>nwalarm.mib</code>). The <code>nwtrap.cfg</code> file contains configuration parameters for <code>nwtrap.nlm</code> .
<code>findnms.nlm</code>	Used by NetWare servers running the Management Agent for NetWare. Employ <code>findnms.nlm</code> to listen for SNMP Management console advertising themselves using the Service Advertising Protocol (SAP) number 0x026a. <code>Findnms.nlm</code> then adds the Internetwork Packet Exchange™ (IPX™) address of each Novell ConsoleOne discovered to the list of stations that receive traps.
<code>ndstrap.nlm</code>	Implements the <code>ndstrap.mib</code> to capture and forward Novell eDirectory events to SNMP Management console.
<code>mondata.nlm</code>	Allows you to monitor NetWare servers.

Table 30-2 provides a brief description of the enterprise MIBs associated with the Management Agent for NetWare:

Table 30-2 List of Enterprise MIBs associated with the Management Agent for NetWare

MIB Name	Description
<code>ndstrap.mib</code>	A Novell proprietary MIB designed to capture Novell eDirectory events and forward them to SNMP Management console as SNMP traps. There are more than 130 traps currently in the MIB and new ones are being added as they are identified.
<code>nwalarm.mib</code>	A Novell proprietary MIB that handles all the NetWare Core OS alerts and forwards them as SNMP traps. It currently supports more than 375 traps and new ones are being added as they are identified.
<code>nwhostx.mib</code>	A Novell extension to RFC1514 (the Host Resources MIB). It adds devices and components that are specific to NetWare that were not directly included in RFC1514.
<code>nwserver.mib</code>	A Novell proprietary MIB that is the basis for NetWare Core OS management. More than 300 objects are identified in this MIB. Access to the parameters that can be set from the console for both GET and SET is defined. The MIB has several groups and tables for users, file systems, volumes, queues, Open Data-Link Interface™ (ODI™), set parameters, and so forth.
<code>nwtmsync.mib</code>	A Novell proprietary MIB that allows for SNMP management of <code>timesync.nlm</code> . It provides access to the list of time sources as well as time clients. You may also access the clock structure through this MIB.

MIB Name	Description
nwtrend.mib	A Novell proprietary MIB that keeps track of objects that are most useful when tracked over a period of time. For example, CPU utilization and packets received have limited value as static numbers, but when monitored at regular intervals for a period of time, they tell a great deal about what is happening on a server. This MIB also lets you set user-definable thresholds for the managed objects and will send SNMP traps when a threshold is exceeded.
rfc1514.mib	The Internet Standard Host Resources MIB. It defines general categories about a host machine, including physical components of the system such as disks, memory, CPU, printers, adapter cards, and so forth.

30.1.2 Management Agent for Windows Server Files

Table 30-3 lists files that can be manually configured with a text editor to modify default results of the Management Agent for Windows:

Table 30-3 *List of Management Agent for Windows files*

Management Agent for Windows Server .INI Files	Description
n_nttren.ini	Specifies the initial values for the trends and thresholds supported by the Management Agent for Windows.
nttrap.ini	Specifies settings to troubleshoot your Windows server that runs the Management Agent for Windows and settings to enable you to send Windows events to the management system as SNMP traps.
nthost.ini	Specifies the SNMP settings supported by the Management Agent for Windows.
n_ntfmw.ini	Allows you to specify IPX addresses that will be ignored and will not receive SNMP traps.

Table 30-4 provides a brief description of the enterprise MIBs associated with the Management Agent for Windows. In addition, the Management Agent for Windows converts all Windows system, security, and application events to SNMP traps.

Table 30-4 *List of Enterprise MIBs associated with the Management Agent for Windows*

MIB Name	Description
ntserver.mib	Gives minimal Windows system information like Server Name, OS, major and minor versions, time zone, remote and local volumes count, etc.
rfc1514.mib	The Internet Standard Host Resources MIB. It defines general categories about a host machine, including physical components of the system such as disks, memory, CPU, printers, adapter cards, and so forth.
nttrap.mib	A generic MIB based on RFC1514. Windows events that are converted into traps are forwarded to the Novell ZENworks Server Management network management system.

MIB Name	Description
nttrend.mib	A Novell proprietary MIB that keeps track of objects that are most useful when tracked over a period of time. For example, CPU utilization and packets received have limited value as static numbers, but when monitored at regular intervals for a period of time, they tell a great deal about what is happening on a server. This MIB also lets you set user-definable thresholds for the managed objects and will send SNMP traps when a threshold is exceeded.

30.2 Customizing the Management Agent for NetWare

The Management Agent for NetWare installation process creates the `nma2.ncf` file (Novell NetWare 3.x and 4.x servers) or the `nma5.ncf` file (NetWare 5.x servers) in the `sys:\zfs_agnt\nma` directory. When the NetWare server is started, this file automatically loads all the NLM files required for the Management Agent for NetWare in a default configuration state. There are, however, several LOAD parameters that you can configure for each of the NLM files used with the agent.

You can configure your server to use these options by editing the `nma2.ncf` or `nma5.ncf` file on your server. Also, if your server is already running, you can unload any of these NLM files and then load them at the NetWare server console using any of the configuration parameters. You can configure these parameters at the NetWare server console or by using the NetWare remote console utility, RCONSOLEJ.

The sections that follow describe each of the command line parameters that you can configure for the Management Agent for NetWare.

- ♦ [Section 30.2.1, “servinst.nlm Load Parameters,” on page 1124](#)
- ♦ [Section 30.2.2, “hostmib.nlm Load Parameters,” on page 1125](#)
- ♦ [Section 30.2.3, “ntrend.nlm Load Parameters,” on page 1126](#)

30.2.1 servinst.nlm Load Parameters

`Servinst.nlm` implements the `nwserver.mib` NetWare Server MIB. You can load `servinst.nlm` at the command line with any or all of the following parameters:

```
LOAD SERVINST D, U=n, V, B=n H
```

Table 30-5 List of `servinst.nlm` Load parameters

Parameter	Description
D	DisableSets: If this parameter is present, <code>servinst.nlm</code> does not allow SNMP SET commands for objects in <code>nwserver.mib</code> . Default: SETS enabled (subject to SNMP security).

Parameter	Description
U= <i>n</i>	UpdateInterval= <i>n</i> : Sets the list update interval to <i>n</i> (<i>n</i> is a value in seconds). This determines how often certain internal lists kept by <code>servinst.nlm</code> (such as volumes and queues) are updated. Set this parameter higher to minimize the number of CPU cycles used by <code>servinst.nlm</code> , or lower to guarantee immediate reporting of server status changes that affect the lists. Default: 300 seconds.
V	Verbose: Displays informational messages. Default: Off.
B= <i>n</i>	BuildUserListHour= <i>n</i> : The local time each day on a 24-hour clock (0 to 23) at which the <code>servinst.nlm</code> software builds a list of users that have access to the server. Default: 2 (2:00 AM).
H	Help: Displays help on command line parameters. If you use the H parameter, <code>servinst.nlm</code> displays the help messages and then exits. It does not remain loaded even if other parameters are entered on the command line. Default: Off.

30.2.2 hostmib.nlm Load Parameters

`Hostmib.nlm` implements both the standard Host Resources MIB (RFC 1514) and the Novell extensions to the Host Resources MIB (`nwhostx.mib`). You can load `hostmib.nlm` at the command line with any or all of the following parameters:

```
LOAD HOSTMIB.NLM D, U=n, V, H
```

Table 30-6 List of `hostmib.nlm` Load parameters

Parameter	Description
D	DisableSets: If this parameter is present, <code>hostmib.nlm</code> does not allow SNMP SET commands for objects in RFC1514.MIB or <code>nwhostx.mib</code> . Default: SETS enabled (subject to SNMP security).
U= <i>n</i>	UpdateInterval= <i>n</i> : Sets the list update interval to <i>n</i> (<i>n</i> is a value in seconds). This determines how often certain internal lists kept by <code>hostmib.nlm</code> are updated. Set this parameter higher to minimize the number of CPU cycles used by <code>hostmib.nlm</code> , or lower to guarantee immediate reporting of server status changes that affect the lists. Default: 60 seconds.
V	Verbose: Displays informational messages. Default: Off.
H	Help: Displays help on command line parameters. If you use the H parameter, <code>hostmib.nlm</code> displays the help messages and then exits. It does not remain loaded even if other parameters are entered on the command line. Default: Off.

30.2.3 ntrend.nlm Load Parameters

Ntrend.nlm implements the Threshold and Trend MIB (nwtrend.mib).

When first loaded, ntrend.nlm automatically sets trends and thresholds for each monitored attribute according to the server's configuration from values stored in the ntrend.ini file (located in the sys:\etc directory). You can edit this file as described in [“Setting Default Trends and Thresholds” on page 963](#).

Thereafter, as configuration changes occur over time, ntrend.nlm adjusts to changes in the number and type of physical network interfaces, queues, volumes, and disks. Default thresholds are set only for important parameters. You can later use SNMP SET commands to set thresholds for parameters such as files read and packets in.

A trend file is created for each monitored attribute instance, even if trending is disabled for that object. The file header contains all the information from nwtControlTableEntry, and the rest of the file stores the sample history (if any). After a trend file is created, it exists until explicitly deleted by the operator, even if the monitored object (a queue, for example) no longer exists. When a monitored object no longer exists, the associated nwtControlStatus is recorded as invalid.

You can load ntrend.nlm at the command line with any or all of the following parameters:

```
LOAD NTREND D=dir, R, V, H
```

Table 30-7 List of ntrend.nlm Load parameters

Parameter	Description
D= <i>dir</i>	<p>Directory=<i>dir</i>: Enables you to specify the volume and directory where ntrend.nlm stores the history data files. Example: To use vol1:\test as the directory for trending files, enter the following command:</p> <pre>load ntrend D=vol1:\test</pre> <p>Default: sys:\ntrend.</p>
R	<p>Reset: Causes ntrend.nlm to discard all the old trending history data and restart the sampling.</p>
V	<p>Verbose: Displays informational messages.</p> <p>Default: Off.</p>
H	<p>Help: Displays help on command line parameters.</p> <p>Default: Off.</p>

30.3 Customizing the Management Agent for Windows Server

You can manually edit the files listed in [Table 30-8](#) to modify the default Management Agent for Windows configuration on a managed Windows server:

Table 30-8 Management Agent for Windows Server .INI files

Management Agent for Windows Server .INI Files	Description
n_ntfmw.ini	Allows you to specify IPX addresses that will be ignored and will not receive SNMP traps.
nttrap.ini	Specifies settings to troubleshoot your managed Windows servers and set trap filters to specify which Windows events are sent to the management system as SNMP traps. See “Controlling Alarm Generation” on page 967 for detailed information on configuring trap filters and trap generation. The Server Management Agent has been enhanced with the following features: Section 30.3.2, “Collecting Events from Custom Event Log Types,” on page 1127 and Section 30.3.3, “Specifying Negative Filter Conditions in the Nttrap.ini File,” on page 1128 .
n_nttren.ini	Specifies the initial values for the trends and thresholds supported by the Management Agent for Windows. See “Setting Default Trends and Thresholds” on page 963 for detailed information on modifying default trends and thresholds.

30.3.1 Configuring the Management Agent for Windows Server

By default, the Management Agent for Windows sends traps to SNMP Management console on IPX networks broadcasting the 0x026 Service Advertising Protocol (SAP) ID. You can edit the `n_ntfmw.ini` file to include the IPX addresses of SNMP Management console that you do not want to include as trap targets.

To add the IPX address of a SNMP Management console to omit as an automatic trap recipient:

- 1 Open the `n_ntfmw.ini` file in a text editor.
- 2 Add the IPX address for omitted SNMP Management console using the following syntax:

```
xxxxxxx.yyyyyyyyyyyy
```

where `xxxxxxx` is the net address and `yyyyyyyyyyy` is the node address, such as `01014044.00001B4DDAFD`.
- 3 Save the file and restart the Management Agent for Windows.

30.3.2 Collecting Events from Custom Event Log Types

The Server Management Agent for Windows collects events from Windows Event Log and converts these events to traps. The traps are forwarded to the site server.

You can now use the Server Management Agent for Windows to specify custom event log types to collect traps from DNS server, directory service log, file replication service log, etc. using the `nttrap.ini` file.

- 1 Open the `nttrap.ini` file from the `installation_path\zfs_agnt\ntagent\ini` directory.

- 2 In the Monitor Settings section, enable the event for custom log types according to the instructions in the file.
- 3 Save the `nttrap.ini` file.

30.3.3 Specifying Negative Filter Conditions in the Nttrap.ini File

The Server Management Agent for Windows now enables you to specify conditions with negatives.

To specify negative filter conditions in the `nttrap.ini` file:

- 1 Open the `nttrap.ini` file from the `installation_path\zfs_agnt\ntagent\ini` directory.
- 2 In the Available Filters section, and specify the negative filter conditions. For example, Collect events except event with the ID as 500.
- 3 In the Actual Filters section, enable these filters.
- 4 Save the `nttrap.ini` file.

For more information about filter conditions and examples in the `nttrap.ini` file, see [TID 10098619](http://support.novell.com/cgi-bin/search/searchtid.cgi?10098619.htm) (<http://support.novell.com/cgi-bin/search/searchtid.cgi?10098619.htm>) in the Novell Support Knowledgebase.

30.4 Third-Party Agent Configuration

Third-party SNMP agents require the following tasks to be completed before traps are received:

- ♦ [Section 30.4.1, “Ensuring that Traps Are Received,” on page 1128](#)
- ♦ [Section 30.4.2, “Integrating Vendor-Specific SNMP Traps,” on page 1128](#)

30.4.1 Ensuring that Traps Are Received

When configuring the SNMP agent or SNMP Remote Network Monitoring (RMON) agent on a network device, configure the agent's trap destination list (trap-target list) to include the Novell ZENworks Server Management management server station IP address or server name. Refer to the agent's documentation for information on configuring this. Novell ConsoleOne displays alarms for all devices that forward alarms to the management server.

If your network device is using the Management Agent for NetWare, Management Agent for Windows Server, NetWare Traffic Analysis[®] Agent[™], or the Traffic Analysis Agent for Windows, the agent's trap destination list is automatically configured for you. For information on configuring the trap destination list, see [Section 23.2, “Setting Up Discovery,” on page 902](#) for configuration information and [Chapter 29, “Understanding Traffic Analysis,” on page 1031](#) for information on configuring the RMON agents.

30.4.2 Integrating Vendor-Specific SNMP Traps

Before the Alarm Management System can process the alarm, you must include vendor-specific MIBs for the third-party SNMP agents in the management server MIB pool. You can further integrate third-party SNMP agents by annotating the trap definitions in the vendor MIB.

The Alarm Management System interprets ASN.1 annotations to trap definitions in a MIB to set the severity level and device status assigned to an alarm. The MIBs included with Novell ZENworks Server Management already include the proper annotations. The annotations provide detail on severity levels and device status to the Alarm Management System.

See [Chapter 26, “Using the MIB Tools,” on page 999](#) for information on adding a MIB to the management server's MIB pool and annotating third-party MIBs.

30.5 Advanced Trending Agent

This section contains the following information:

- ♦ [Section 30.5.1, “What Is the Advanced Trending Agent?,” on page 1129](#)
- ♦ [Section 30.5.2, “Configuring the Trend Variables,” on page 1129](#)
- ♦ [Section 30.5.3, “Configuring the Advanced Trending Agent on Linux,” on page 1130](#)
- ♦ [Section 30.5.4, “Configuring the Advanced Trending Agent on All Platforms,” on page 1131](#)
- ♦ [Section 30.5.5, “Quick Reference Table,” on page 1132](#)
- ♦ [Section 30.5.6, “Refreshing Configuration Settings,” on page 1133](#)
- ♦ [Section 30.5.7, “Installing the Advanced Trending Agent,” on page 1134](#)

30.5.1 What Is the Advanced Trending Agent?

The Advanced Trending Agent is an application that gathers and stores the trend data (historic data) for any parameter instrumented by an SNMP agent, if it is defined by a MIB variable and not just pre-configured MIB variables.

The Advanced Trending Agent functionality is available on NetWare, Windows, and Linux platforms.

The Advanced Trending Agent periodically collects and stores the samples of the configured MIB variables. The collected data is exposed through an SNMP interface. This data can be used to view the long-term trend graphs of the parameters.

You can configure the Advanced Trending Agent using a configuration file or through SNMP interface. The Advanced Trending Agent includes a command line utility, which reads the configuration file for any updates. The utility also resets the data collected and starts collecting new data. You can also configure the Advanced Trending Agent with threshold values for the parameters and generate a trap when the value exceeds the threshold value.

30.5.2 Configuring the Trend Variables

The Advanced Trending Agent starts trending on MIB variables specified in a configuration file.

- ♦ **On NetWare:** `installation_path/advtrend/advtrend.ini`
- ♦ **On Windows:** `installation_path/advtrend/ini/advtrend.ini`
- ♦ **On Linux:** `/etc/opt/novell/Novell_ZENworks/zfs-mms-advtrend.conf`

You can modify the contents to add new parameters to trend upon or modify existing ones. The configuration file follows a standard INI format.

The section name can contain any value and is typically a meaningful name for the parameter being configured. All the section names in a given file must be distinct.

IMPORTANT: You cannot change the name of the section. If you do so, the data for the parameters is lost and new data is collected.

You cannot change the names of the keys. Each key represents a particular configuration that defines the trending activity for that parameter. There are certain mandatory keys that must be defined for any section. If these keys are not present, the Advanced Trending Agent ignores the entire section.

In a set of the configuration keys, some of the keys are treated as mandatory keys. That particular Configuration entry is read-only if the data for the Mandatory configuration keys is supplied or if the particular configuration entry is discarded.

A typical section looks like this:

```
[Interface In-Octets]
MIBVariable=1.3.6.1.2.1.2.2.1.10.1
MIBVariable Type=1
MIBVariableTrendingStatus=1
MIBVariableDisplayName=Interfaces
SampleInterval=5
SampleType=1
Buckets=80
ThresholdRising=100
ThresholdFalling=60
AlarmType=1
AlarmSeverity=4
ThresholdAlarmGenerationStatus=1
IdentifierOID={1.3.6.1.2.1.2.2.1.10.3}
Filters=2
F1={I1=MS TCP Loopback interface}
F2={I1=3COM 3C920 Integrated Fast Ethernet Controller 3C905C-TX Compatible) -
Packet Scheduler Miniport}
FilterType=1
```

You must specify the following mandatory keys:

- MIBVariable (key 1)
- SampleInterval (key 5)
- ThresholdRising (key 8, only if ThersholdAlarmGenerationStatus=1)
- ThresholdFalling (key 9, only if ThersholdAlarmGenerationStatus=1)
- AlarmType1 (key 10, only if ThersholdAlarmGenerationStatus=1)

For more information, see [Section 30.5.5, “Quick Reference Table,” on page 1132](#).

30.5.3 Configuring the Advanced Trending Agent on Linux

Before starting the Advanced Trending Agent on Linux, ensure that you have completed the following tasks:

- ♦ [“Enabling the SNMPv1/SNMPv2c Access for the Local Host” on page 1131](#)

- ♦ “Configuring the Trap Sink for Sending SNMP v1 Traps to the Site Server” on page 1131
- ♦ “Changing the Default Community String Used by the Advanced Trending Agent” on page 1131

Enabling the SNMPv1/SNMPv2c Access for the Local Host

You must configure the `snmpd` master agent so that it allows SNMPv1/v2c read-only access to the Advanced Trending Agent.

- 1 Edit the `snmpd.conf` file that is used by the `snmpd` master agent.
- 2 Ensure that the access control settings allow SNMPv1/SNMPv2c access to the local host on the entire OID tree (starting with .1)

For more information, refer to the question, How do I configure access control in the [SNMP Frequently Asked Question \(http://www.net-snmp.org/FAQ.html\)](http://www.net-snmp.org/FAQ.html).

Configuring the Trap Sink for Sending SNMP v1 Traps to the Site Server

You must configure the `snmpd` master agent so that the traps generated by the Advanced Trending Agent are sent to the site server.

- 1 Edit the `snmpd.conf` file.
- 2 Add a line to configure a trap-sink pointing to the site server.

Refer to `man snmpd.conf (5)` man page for the specific syntax to configure a trap sink.

Changing the Default Community String Used by the Advanced Trending Agent

You must configure the Advanced Trending Agent to use the same community string you have used to allow access in the [Enabling the SNMPv1/SNMPv2c Access for the Local Host](#) section.

- 1 Edit the `/etc/opt/novell/Novell_ZENworks/zfs-mms-advtrend.conf` configuration file.
- 2 In the Agent Config section, set the value of the `ReadCommunity` key to the appropriate community string for which you have allowed SNMPv1/SNMPv2c access.

30.5.4 Configuring the Advanced Trending Agent on All Platforms

To configure the Advanced Trending Agent, you must change the default purge interval.

The Advanced Trending Agent automatically trends on certain available MIB variables or specific instances of some SNMP tables. If these instances become unavailable, you can clean up the resources associated with the trending. You must configure the purge interval the Advanced Trending Agent should wait before this occurs.

- 1 Edit the configuration file:
 - ♦ **On NetWare:** `installation_path/advtrend/advtrend.ini`
 - ♦ **On Windows:** `installation_path/advtrend/ini/advtrend.ini`
 - ♦ **On Linux:** `/etc/opt/novell/Novell_ZENworks/zfs-mms-advtrend.conf`
- 2 In the Agent Config section, set the value of `PurgeInterval` key to a value in seconds.

30.5.5 Quick Reference Table

Table 30-9 *Values of the keys*

Key Name	Explanation	Allowed Values	Mandatory	Default Value
MIBVariable	The variable to trend on	Any integer valued SNMP OID	Yes	None
MIBVariableType	Whether the variable is scalar or whether it is a column in an SNMP table	1 (Scalar), 2 (Columnar)	No	1
MIBVariableTrendingStatus	Whether the trending is enabled on this or disabled	1 (Enabled), 2 (Disabled)	No	2
MIBVariableDisplayName	The name to refer to this variable from console Views	Any string	No	Object
SampleInterval	The time interval in seconds indicating when to take the sample	Positive integer	Yes	None
SampleType	Whether samples stored must be absolute values or deltas	1 (Absolute), 2 (Delta)	-	-
Buckets	Number of samples to store for a variable	Positive integer	No	50
ThresholdAlarmGenerationStatus	Whether to send traps or not	1 (Enabled), 2 (Disabled)	No	2
ThresholdRising	If the sample value exceeds the first time and the AlarmType value is set to rising, send a trap	Integer	Yes, if ThresholdAlarmGenerationStatus is enabled	None
ThresholdFalling	If the sample value falls exceeds the first time and the AlarmType value is set to Falling, send a trap	Integer	Yes, if ThresholdAlarmGenerationStatus is enabled	None

Key Name	Explanation	Allowed Values	Mandatory	Default Value
AlarmType	Whether the trap should be generated for exceeding the ThresholdRising or ThresholdFalling value	1 (Rising), 2 (Falling)	Yes, if ThresholdAlarmGenerationStatus is enabled	None
AlarmSeverity	Criticality of the trap that is sent.	1 Severe 2 Major 3 Minor 4 Information 5 Unknown	No	3
IdentifierOID	For an OID of MIBVariableType 2, this uniquely identifies the rows in a table.	A formatted string	No	None
Filters	Number of filter conditions specified.	Integer between 1 and 5	No	None
FilterType	Whether a SNMP row that matches a filter must be trended or ignored.	1 Inclusive (include), 2 Exclusive (ignore)	No	1

30.5.6 Refreshing Configuration Settings

The Advanced Trending Agent enables you to dynamically change the parameters of the trending activity for one or more MIB variables. You can add new entries or remove existing entries that are being trended in the configuration file.

After you make the changes, you must enter the `advtrend` command for the Advanced Trending Agent to retrieve the latest information. The `advtrend` command is available in the following locations:

- ◆ **On Windows:** `install_directory/zfs_agnt`
- ◆ **On Linux:** `/opt/novell/novell zenworks/bin`

Use the `advtrend` command to perform the following operations:

- ◆ “Reset the Information” on page 1134
- ◆ “Adding a New Parameter for Trending” on page 1134
- ◆ “Removing an Existing Trended Parameter” on page 1134
- ◆ “Modifying the Values of the Keys for an Existing Parameter” on page 1134

Reset the Information

If you want to restart trending the parameters:

- 1 Make changes to the configuration file to add, modify, or delete any configuration sections.
- 2 At the server prompt, enter `advtrend reset`.

The new entries will replace existing entries according to the configuration settings. The trending will start from the beginning.

WARNING: Once you reset the information, the old data will be lost.

Adding a New Parameter for Trending

- 1 Edit the configuration file to include a new section for your parameter.
- 2 Define the required keys in the new section.
- 3 At the server prompt on NetWare enter `advtrend reread`, and for Windows or Linux, enter `advtrend read_cfg`.

The new entries to be trended are appended.

Removing an Existing Trended Parameter

1. Edit the configuration file to remove the section representing the parameter being trended.
2. At the server prompt on NetWare enter `advtrend reread`, and for Windows or Linux, enter `advtrend read_cfg`.

The entries to be trended for this configuration section are removed.

Modifying the Values of the Keys for an Existing Parameter

If you want to modify the values for the keys of an MIB variable being trended, do the following:

- 1 Edit the configuration file to change the values of the keys.
- 2 At the server prompt, on NetWare enter `advtrend reread`, and for Windows or Linux, enter `advtrend read_cfg`.

The Advanced Trending Agent will now use the new parameters.

If you modify the following parameters, the previous data will be removed:

```
MIBVariable
MIBVariableType
SampleInterval
SampleType
IdentifierOID
```

30.5.7 Installing the Advanced Trending Agent

For more information on how to install the Advanced Trending Agent, see the *Novell ZENworks 7 Server Management Installation Guide*.

30.6 Management and Monitoring Services for Linux

The Management and Monitoring Services component of Novell ZENworks Server Management for Linux now provides you with the ability to centrally manage and administer the Linux servers on your network.

You can view all the real time statistical information and the historical information as views from Novell ConsoleOne®. You can manage traps generated for important events, obtain historical information about the Linux servers and view all the information as views from Novell ConsoleOne and generate reports about the overall health of your Linux server.

The Linux Management Agent of Management and Monitoring Services allows you to manage and monitor all the information about your Linux servers.

- ♦ [Section 30.6.1, “Providing Real Time Statistical Information,” on page 1135](#)
- ♦ [Section 30.6.2, “Generating Traps for System Events,” on page 1136](#)
- ♦ [Section 30.6.3, “Providing History Collection Information,” on page 1138](#)
- ♦ [Section 30.6.4, “Linux Management Views,” on page 1138](#)
- ♦ [Section 30.6.5, “Linux Server Health Reports,” on page 1139](#)

30.6.1 Providing Real Time Statistical Information

The Linux Management Agent is an SNMP agent that gathers and provides real time statistical information on some of the critical resources of the server.

The Linux Management Agent provides the following statistical information:

- ♦ Processor statistics
- ♦ System level memory usage
- ♦ Disk usage and statistics
- ♦ Partition usage statistics
- ♦ Init.d services statistics
- ♦ Process information
- ♦ User login statistics
- ♦ Kernel cache information
- ♦ Disk partition statistics
- ♦ System paging and swapping
- ♦ Interrupt Statistics on various processors

Customizing the Configuration File

Using the `zfs-mms-servinst.conf` file, you can customize the Linux Management Agent to monitor the real-time statistics. You can change the list of services that are automatically monitored in the `zfs-mms-servinst.conf` file.

- 1 Open the `zfs-mms-servinst.conf` file in the `/etc/opt/novell/novell zenworks` directory.

- 2 In the Monitored Services section, add or remove the service name from list of services.
- 3 Save the `zfs-mms-servinst.conf` file.
- 4 Restart the `snmpd`.

30.6.2 Generating Traps for System Events

The Linux Management Agent gathers important and critical events about the running server processes. Based on the criticality of the events, traps are generated and forwarded to the site server. The Linux Management Agent includes the `novell-trapd` service that monitor various categories of system logs for these events. Some of the categories of events gathered from the system logs include:

- ◆ User login
- ◆ Root login failures
- ◆ Service start/stop/restart
- ◆ Important kernel events logged

Customizing the Configuration File

Using the `zfs-mms-log2trap.conf` file, you can customize the Linux Management Agent to monitor the events for which the traps are generated.

You can do the following methods:

Changing the list of hosts where the traps are forwarded

- 1 Open the `zfs-mms-log2trap.conf` file in the `/etc/opt/novell/novell zenworks` directory.
- 2 In the `TrapTargets` section, add the IP addresses of the hosts where you would like the traps to be sent. In the same line, add the SNMP community string that is used to send the traps.
- 3 Save the `zfs-mms-log2trap.conf` file.
- 4 Restart the `novell-trapd` service.

Preventing the trap generation for certain system log messages

Using the `zfs-mms-log2trap.conf` file you can prevent the traps from being generated for certain system log messages. You must create sections within the configuration file and include the keys in [Table 30-10](#):

Table 30-10 List of keys and its possible values to be used in the system log messages

Key Name	Description	Possible Values
Severity	The severity of the log message to be ignored.	<ul style="list-style-type: none"> ◆ CRITICAL ◆ MAJOR ◆ MINOR ◆ INFORMATIONAL ◆ MISCELLANEOUS ◆ ALL
Constraints	Defines how a log message should be searched for a substring. If the substring satisfies the conditions specified, this log message is ignored.	<p>The possible values are an optional CASE_COMPARE and one of CONTAINS or ENDS_WITH or BEGINS_WITH.</p> <p>The optional CASE_COMPARE specifies if a case-sensitive search is required on the string. The other values specify whether the string must be contained in the log, or the end of the log or the beginning of the log respectively.</p>
string <i>number</i>	Defines a string that is searched should be searched. You can define any number of such keys, by incrementing the value of <i>number</i> . A message that matches any one of these values is ignored.	Any string.

Example: Rejecting all log messages containing the string telnet

- 1 Open the `zfs-mms-log2trap.conf` file in the `/etc/opt/novell/Novell ZENworks` directory.
- 2 Create a section in the configuration file. For example [Telnet Reject].
- 3 Add the following keys and values:

```
severity = ALL
constraints = CASE_COMPARE
string1 = telnet
```
- 4 Search for the section `_Reject Setting Names_`, and add the section name. For example, Telnet Reject.
- 5 Save the configuration file.
- 6 Restart the `novell-trapd` service.

Example: Rejecting all messages with severity value as Info containing the string 127.0.0.1 or localhost

- 1 Open the `zfs-mms-log2trap.conf` file in the `/etc/opt/novell/Novell ZENworks` directory.
- 2 Create a section in the configuration file. For example [Localhost].
- 3 Add the following keys and values:

```

severity = INFO
constraints = CASE_COMPARE
string1 = 127.0.0.1
string2 = localhost

```

- 4 Search for the section `_Reject Setting Names_`, and add the section name. For example, `Localhost`.
- 5 Save the configuration file.
- 6 Restart the `novell-trapd` service.

30.6.3 Providing History Collection Information

The Linux Management Agent implements the SNMP instrumentation for the Linux Operating System for additional information. Using the SNMP interface information the following attributes of the Linux Operating System can be obtained:

- ◆ CPU Utilization
- ◆ Used Memory and Used Swap Size
- ◆ Disk Free Space
- ◆ Network Interface Statistics (incoming and outgoing packet count)
- ◆ Disk Reads and Writes
- ◆ Logged in User Count

Using Advanced Trending agent you can configure and control periodic statistical sampling for any of the above parameters. Using the Advanced Trending Agent you can also set thresholds to generate traps for the above attributes.

For more information on the Advanced Trending Agent, see [Section 30.5, “Advanced Trending Agent,” on page 1129](#).

30.6.4 Linux Management Views

Using the Unified View for Devices, you can list all the Linux devices on your network.

The following views are created in Linux to enable you to access more information about a Linux server:

- ◆ Node Summary
- ◆ Processor Statistics and Trend
- ◆ Storage Devices Summary and Trend
- ◆ Running Software
- ◆ Interrupt Summary Node
- ◆ Memory Statistics and Trend
- ◆ Network Interface Statistics and Trend
- ◆ Currently Logged-in Users and Trend
- ◆ Services Started by the Node

The Linux Management views are similar to the views on NetWare and Windows servers.

30.6.5 Linux Server Health Reports

A new profile called the Linux Server Profile is added to the list of profiles to enable you to generate reports. This reports enables you to obtain information about the overall health of your Linux server. You can use the Linux Server Health Report to generate reports daily, weekly, monthly.

Protocol Decodes Suites Supported by Novell ZENworks Server Management

Novell ZENworks[®] Server Management provides packet capture and decoding tools that help you analyze the network activity and identify the source of network problems. Capturing and decoding packets can help you troubleshoot network problems by giving you detailed information about segment activity. For details, see [“Capturing Packets” on page 1066](#) and [“Displaying Captured Packets” on page 1069](#).

This section provides information about decoding support provided by Novell ZENworks Server Management for the following protocol suites:

- ♦ [Section 31.1, “Novell NetWare Protocol Suite,” on page 1141](#)
- ♦ [Section 31.2, “Network File System Protocol Suite,” on page 1143](#)
- ♦ [Section 31.3, “Systems Network Architecture Protocol Suite,” on page 1143](#)
- ♦ [Section 31.4, “AppleTalk Protocol Suite,” on page 1144](#)
- ♦ [Section 31.5, “TCP/IP Protocol Suite,” on page 1145](#)

31.1 Novell NetWare Protocol Suite

Novell NetWare[®] contains a group of protocols that perform various functions in a Novell NetWare network. Each protocol in the Novell NetWare protocol suite works with the IPX[™] protocol. Novell ZENworks Server Management supports the following protocols in the Novell NetWare suite of protocols:

Table 31-1 *Novell NetWare suite of protocols*

Novell NetWare Protocol	Description
BCAST	Novell NetWare Broadcast Message Notification. The protocol a Novell NetWare server uses to inform an idle workstation that a message is pending. This message appears on the top or bottom line of the monitor on DOS stations.
DIAG	Diagnostic Responder. A protocol used for connectivity testing and information gathering. By default, Novell NetWare clients use the Diagnostic Responder to reply to diagnostic requests.
IPX	Internetwork Packet Exchange [™] . A protocol that routes outgoing data packets across a network. Every Novell NetWare network has a unique address assigned when its servers are configured. IPX routers use this address to route packets through an internetwork. IPX makes routing decisions based on information compiled by the Routing Information Protocol (RIP).

Novell NetWare Protocol	Description
LSP	Novell NetWare Lite™ Sideband Protocol. A connectionless (datagram) oriented protocol that operates as a sideband for Novell NetWare Lite Transport Protocol (NLTP) connections.
NBIOS	NetBIOS. An emulator that allows workstations to run applications that support IBM* NetBIOS calls. NetBIOS is the IBM standard protocol for applications developed to run peer-to-peer communications on token ring networks.
NCP™	Novell NetWare Core Protocol™. A set of procedures that a file server operating system follows to accept and respond to workstation requests. An NCP exist for every service a workstation might request from a file server. Common requests handled by the NCP protocols include creating or deleting a file, manipulating directories and files, performing a directory listing, altering the bindery (drive mappings and security), and printing.
NDS®	The NDS protocol, called the Novell Directory Access Protocol (NDAP), is a wire protocol that allows Novell eDirectory to service client requests and to send client requests to other Novell eDirectory servers. NDAP is built based on NCP.
NLP	Novell NetWare Lite Protocol. A protocol that is an integral part of Novell NetWare Lite, which operates on top of the Novell IPX protocol. NLP is an application-layer and service-layer protocol that performs file system and print functions. NLP also uses NLTP, which is similar in function to the transport protocol used in NCP.
NLSP™	Novell NetWare Link Services Protocol™. A link-state routing protocol designed for IPX internetworks.
RIP	Routing Information Protocol. A protocol that automates the process of updating routing tables. Routing is the process of moving network packets between separate networks. With RIP, when one router learns about changes in its routes, it broadcasts this information to neighboring routers so they can update their routing tables. As a result, if a network component fails (such as a router or a phone line), the other network components can inform each other of alternate routes. When the faulty component is repaired, the network changes back to the previous condition.
SAP	Service Advertising Protocol. A protocol that lets Novell NetWare servers advertise their services by name and type. A workstation can broadcast a request to find all services available or a specific service closest to the client.
SER	Novell Serialization (Copy Protection) Packets. Packets that Novell NetWare servers send to other Novell NetWare servers to ensure that each server has a unique serial number.
SNMP	Simple Network Management Protocol. An application-layer protocol designed to facilitate the exchange of management information between network devices. By using SNMP to access management information data (such as packets per second and network error rates), network administrators can easily manage network performance and find and solve network problems.

Novell NetWare Protocol	Description
SPX™	<p>Sequenced Packet Exchange™. A connection-oriented transport protocol that monitors network transmissions to ensure successful delivery of packets. SPX enhances the IPX protocol by supervising data sent across the network. SPX can track data transmissions consisting of a series of separate packets.</p> <p>SPX also requests acknowledgments from and returns acknowledgments to a communications partner, ensuring successful data delivery. If an acknowledgment request brings no response within a specified time, SPX retransmits the request. After a reasonable number of retransmissions fail to return a positive acknowledgment, SPX assumes the connection has failed and reports the error.</p> <p>The Novell NetWare print server uses SPX.</p>
WDOG	<p>Watchdog. A maintenance protocol provided with Novell NetWare. Watchdog monitors stations that are logged in to a Novell NetWare server. Watchdog determines whether the Novell NetWare shells are still operating and, if not, releases the connection.</p>

31.2 Network File System Protocol Suite

The Network File System (NFS) suite of protocols is described in [Table 31-2](#):

Table 31-2 *Network File System (NFS) suite of protocols*

Network File System Protocol	Description
MOUNT	The MOUNT protocol, used in conjunction with NFS, performs operating system-specific functions that allow NFS clients to attach remote directory trees to a point within the local file system.
NFS	Network File System. This protocol provides transparent remote access to shared file systems across networks. NFS uses Remote Procedure Call (RPC) and is machine, operating system, network architecture, and transport protocol independent.
PORTMAP	The PORTMAP protocol converts RPC program numbers into Transmission Control Protocol/User Datagram Protocol (TCP/UDP) port numbers. When a client wants to make an RPC call to a given program number, it will first contact PORTMAP on the remote machine to determine the port number where RPC packets should be sent.
RPC	Remote Procedure Call. This protocol allows a program on one computer to make a subroutine call on a remote computer. Every subroutine or remote procedure is identified by a unique program number.

31.3 Systems Network Architecture Protocol Suite

The Systems Network Architecture (SNA) suite of protocols is described in [Table 31-3](#):

Table 31-3 *Systems Network Architecture (SNA) suite of protocols*

Systems Network Architecture Protocol	Description
RH	Request/Response Header. This protocol carries the SNA Request/Response Units as its payload.
RU	Request/Response Unit. An SNA client uses this protocol to communicate with an SNA server.
TH	Transmission Header. This protocol runs on a data link layer and serves as the transmission layer for an SNA Path Information Unit.
XID	Exchange Station Identification. An SNA node uses this protocol to check whether its peer SNA node is ready for communication and to exchange its station details with it.

31.4 AppleTalk Protocol Suite

The AppleTalk* and AppleTalk-related suite of protocols is described in [Table 31-4](#):

Table 31-4 *AppleTalk and AppleTalk-related suite of protocols*

AppleTalk Protocol	Description
AARP	AppleTalk Address Resolution Protocol. An AppleTalk protocol that reconciles addressing differences between a data link protocol and the rest of a protocol family. For example, by resolving the differences between an Ethernet addressing scheme and the AppleTalk addressing scheme, AARP facilitates the transport of datagram delivery protocol (DDP) packets over a high-speed EtherTalk* connection.
ADSP	AppleTalk Data Stream Protocol. A connection-oriented protocol that provides a reliable, full-duplex, byte stream service between any two sockets in an AppleTalk internetwork. ADSP ensures sequential, duplicate-free delivery of data over its connections.
AEP	AppleTalk Echo Protocol. A simple protocol that allows a node to send a packet to any other node in an AppleTalk internetwork and receive an echoed copy of that packet in return.
AFP	AppleTalk Filing Protocol. A presentation layer protocol that allows users to share data files and applications that reside in an AppleTalk shared resource, such as a file server.
ASP	AppleTalk Session Protocol. A general, all-purpose protocol that uses the services of the AppleTalk Transaction Protocol (ATP) to provide session establishment, maintenance, and tear-down, along with request sequencing.
ATP	AppleTalk Transaction Protocol. A transport protocol that provides a loss-free transaction service between sockets. This service allows exchanges between two socket clients in which one client requests the other to perform a particular task and report the results. ATP binds the request and response together to ensure the reliable exchange of request-response pairs.

AppleTalk Protocol	Description
E-DDP	Extended Datagram Delivery Protocol. A datagram delivery protocol that uses an extended header. An extended header is required for packets that are transmitted from one network to another network within an AppleTalk Internet.
ELAP	EtherTalk Link Access Protocol. The link-access protocol used in an EtherTalk network. It is built on the top of the standard Ethernet data link layer.
NBP	Name Binding Protocol. A transport layer protocol that translates a character string name into the internetwork address of the corresponding socket client. NBP enables AppleTalk protocols to understand user-defined zones and device names by providing and maintaining translation tables that map these names to corresponding socket addresses.
PAP	Printer Access Protocol. This protocol manages interaction between workstations and print servers. It handles connection setup, maintenance, and termination. It can also handle data transfer.
RTMP	Routing Table Maintenance Protocol. This AppleTalk protocol establishes and maintains the routing information that is required by internetwork routers to route datagrams from any source socket to any destination socket in the internetwork. Using RTMP, internetwork routers dynamically maintain routing tables to reflect changes in internetwork topology.
S-DDP	Short Datagram Delivery Protocol. A DDP that uses a short header. A short header is often used for packets whose source and destination sockets are within the boundaries of a single AppleTalk network.
ZIP	Zone Information Protocol. A protocol that maintains up-to-date routing information across the internetwork.

31.5 TCP/IP Protocol Suite

The TCP/IP suite of protocols is described in [Table 31-5](#):

Table 31-5 *TCP/IP suite of protocols*

TCP/IP Protocol	Description
ARP	<p>Address Resolution Protocol. A protocol used by a host to determine the hardware address of another host. A TCP/IP system contains a table that maps IP addresses to the hardware addresses of the different hosts and routers on the internetwork. This table works in much the same way as a host table, translating an IP address to an Ethernet address. Unlike the host table, however, the ARP table is not usually maintained by you or your network administrator. The ARP protocol creates entries in this table as needed.</p> <p>If the hardware address of the destination is not found in your station's ARP table, a broadcast is sent to every host on the network requesting the address. If that host is up and supports the ARP protocol, it receives the broadcast from your station and responds by sending its hardware address back to your station. This address is then added to your station's ARP table.</p>
IMAP	IMAP stands for Internet Message Access Protocol. It is a method of accessing electronic mail or bulletin board messages that are placed on a (possibly shared) mail server. It permits a "client" e-mail program to access remote message stores as if they were local.

TCP/IP Protocol	Description
BOOTP	BootStrap Protocol. This protocol allows a diskless workstation to determine its IP address and other information without using the Reverse Address Resolution Protocol (RARP).
DHCP	Dynamic Host Configuration Protocol. This protocol supplies hosts with configuration parameters, leases dynamically allocated IP addresses, and acts as an enhancement to BOOTP.
DNS	Domain Name System. The distributed naming service used on the Internet. DNS provides a computer's IP address if domain names exist for the computer.
FTP	File Transfer Protocol. TCP/IP application-layer protocol that supports file transfers.
HTTP	Hypertext Transfer Protocol. An application-layer protocol that Web browsers and Web servers use to communicate with each other.
ICMP	Internet Control Message Protocol. A protocol that works with IP to provide routing efficiency and error information. ICMP is part of the TCP/IP protocol suite. Because IP is connectionless, it cannot detect anomalous internetwork conditions. ICMP works with IP to provide TCP or other upper-layer protocols with this information.
IGMP	Internet Group Management Protocol. A protocol used by IP hosts to report their multicast group memberships to routers. The protocol is also used to query routers on memberships and to generate reports on group membership. Termination of group membership can be quickly reported using this protocol.
IP	<p>Internet Protocol. A protocol that provides connectionless, nonguaranteed delivery of transport layer packets (also called transport protocol data units or TPDU) across an internetwork. IP is part of the TCP/IP protocol suite.</p> <p>IP can fragment TPDU into smaller parts, if necessary, and then reassemble them at an intermediate station (usually a router) or at their destination host.</p> <p>Each TPDU or fragment is fitted with an IP header and transmitted as a packet by lower-layer protocols. IP moves datagrams through the internetwork, one hop at a time. If a TPDU fragment arrives at its destination out of order, IP reassembles the fragments, in sequence, at the destination.</p>
LDAP	Lightweight Directory Access Protocol. This protocol provides access to the x.500 Directory while not incurring the resource requirements of the Directory Access Protocol (DAP). LDAP is specifically targeted at simple management applications and browser applications that provide read/write interactive access to the x.500 Directory, and is intended to be a complement to the DAP itself.
NFS	The Network File System (NFS) protocol provides transparent remote access to shared files across networks. The NFS protocol is designed to be portable across different machines, operating systems, network architectures, and transport protocols. This portability is achieved through the use of Remote Procedure Call (RPC) primitives built on top of an eXternal Data Representation (XDR).
NTP	Network Time Protocol. A protocol used to synchronize timekeeping among a set of distributed time servers and clients. It is used to convey timekeeping information in a hierarchical method from servers to clients. It is also used to cross-check clocks and control errors due to equipment or propagation failures.

TCP/IP Protocol	Description
NWIP	<p>Novell NetWare/IP. Allows total or partial replacement of the IPX transport subsystem with the industry-standard TCP/IP subsystem, in a Novell NetWare network. The following constitute the core components of the technology:</p> <ul style="list-style-type: none"> ◆ Communication between the Novell NetWare/IP server and the Domain SAP/RIP Service (DSS) for <ul style="list-style-type: none"> - Retrieval of configuration parameters - Registration of SAP and RIP information - SAP/RIP database synchronization ◆ Synchronization of the Novell NetWare/IP server with the DSS database with respect to SAP/RIP information ◆ Communication between secondary DSS and primary DSS to synchronize the SAP/RIP database on the two servers
OSPF	<p>Open Shortest Path First. A protocol in the TCP/IP protocol suite is an interior gateway protocol algorithm and is proposed as a standard for the Internet. OSPF incorporates least-cost routing, multipath routing, load balancing, and efficient bandwidth utilization.</p>
POP3	<p>Post Office Protocol 3. A protocol used for interacting with a central mailbox server. It is a client/server protocol used to receive e-mail. The protocol holds the e-mail messages in the Internet server. Periodically, you can download the messages from the server.</p>
RARP	<p>Reverse Address Resolution Protocol. A protocol in the TCP/IP protocol suite that is used to determine a software address based on a hardware address. This protocol is often used by diskless workstations during startup.</p>
RIP	<p>Routing Information Protocol. A protocol in the Novell NetWare protocol suite that automates the process of updating routing tables. Routing is the process of moving network packets between separate networks. With RIP, when one router learns about changes in its routes, it broadcasts this information to neighboring routers so they can update their routing tables. As a result of RIP, if a network component fails (such as a router or a phone line), the other network components can inform each other of alternate routes. When the faulty component is repaired, the network changes back to the previous condition.</p>
SSL	<p>SSL is an open, nonproprietary protocol. It has been submitted to the W3 Consortium (W3C) working group on security for consideration as a standard security approach for World Wide Web browsers and servers on the Internet.</p>
SLP	<p>Service Location Protocol. This protocol provides a scalable framework for the discovery and selection of network services. Using this protocol, computers using the Internet no longer need as many static configurations of network services for network-based applications.</p>
SMTP	<p>Simple Mail Transfer Protocol. The application layer protocol that e-mail clients and servers use to exchange e-mail messages with each other.</p>

TCP/IP Protocol	Description
SNMP	<p>Simple Network Management Protocol. A protocol in the TCP/IP protocol suite that enables you to monitor a network from a single network management station called an SNMP Manager. From an SNMP Manager, you can make inquiries to another network device called the SNMP Agent. The SNMP Agent can be a TCP/IP host, router, terminal server, or another SNMP Manager.</p> <p>The information you can request from an SNMP Agent is contained in the MIB of that TCP/IP host. RFC 1066 (http://www.isi.edu/in-notes/rfc1066.txt) (Internet standard MIB) defines the types of objects that can be in an SNMP Agent MIB. These objects include network and hardware addresses, counters, and statistics, as well as routing and Address Resolution Protocol tables. Different vendors might not support all data types within their MIB or might include other information not defined within the RFC.</p>
TCP	<p>Transmission Control Protocol. This primary Internet transport protocol accepts messages of any length from an upper-layer protocol and provides full-duplex, acknowledged, connection-oriented, flow-controlled transport.</p>
TELNET	<p>Protocol in the TCP/IP suite that governs character-oriented terminal traffic.</p>
TFTP	<p>Trivial File Transfer Protocol. TCP/IP protocol commonly used for software downloads.</p>
UDP	<p>User Datagram Protocol. A protocol similar to TCP that provides connectionless, nonguaranteed transport services. UDP accepts and transports datagrams from an upper-layer protocol. Unburdened by the overhead of establishing and removing connections, controlling data flow, and performing other TCP functions, UDP usually provides a faster data conduit than TCP. For these reasons, and because it is easier to implement, UDP is the transport method of choice for many upper-layer protocols.</p>

Novell ZENworks Management and Monitoring Services Database

Novell ZENworks[®] Server Management provides a centralized Common Information Model (CIM)-compliant Sybase* database on the Management and Monitoring Services management server. The database serves as a repository for server and network data that can be displayed or formatted in various ways to provide you with exactly the information you need to manage your network.

The following sections provide information on understanding and using the Novell ZENworks database:

- ♦ [Section 32.1, “Understanding the Novell ZENworks Server Management Database,” on page 1149](#)
- ♦ [Section 32.2, “Backing Up the Topology/Alarm Database,” on page 1150](#)
- ♦ [Section 32.3, “Changing Database Passwords,” on page 1150](#)
- ♦ [Section 32.4, “Emptying the Database,” on page 1150](#)

32.1 Understanding the Novell ZENworks Server Management Database

The Novell ZENworks Server Management database consists of files located in the `\novell zenworks\mms\db` directory on the management server. The Novell ZENworks Server Management data is stored in the following logical database:

- ♦ Topology/alarm database containing topology, alarms, and map information associated with the following files:
 - ♦ `Mw.db`
 - ♦ `Mw1.db`
 - ♦ `Mw2.db`
 - ♦ `Mw3.db`

The `mw.log` file in the `\novell zenworks\mms\db` subdirectory saves your transaction information with the database files.

- ♦ [Section 32.1.1, “Running the Database,” on page 1149](#)
- ♦ [Section 32.1.2, “Database Caching,” on page 1150](#)

32.1.1 Running the Database

The database is run using the `mgmt dbs.ncf` file (located in the `system` directory on a server volume), which is executed from `autoexec.ncf`.

IMPORTANT: Ensure that the database is running as long as the Novell ZENworks Server Management services are running.

32.1.2 Database Caching

Increasing the database cache improves the database performance. The default database cache size is 48 MB. You can increase the cache size to an optimum level depending on the server memory. To increase the cache size, modify the `-c` option in `sys:\system\mgmt\mtdbs.ncf`. For example, `-c 64M` sets the cache size to 64 MB. Reload the database after modifying the cache size.

32.2 Backing Up the Topology/Alarm Database

You should plan to regularly back up the Novell ZENworks Server Management database. In Novell ConsoleOne, follow this procedure to back up the topology/alarm database:

- 1 Right-click the Site Server object > select *Properties*.
- 2 Select the *Database Administration* tab.
- 3 Enter the path of the directory to back up.

You can back up the database files to any volume on the management server only.

- 4 Click *Apply*.

Novell ZENworks Server Management sends a remote SQL command to store the file. The four `MW*.DB` and `mw.log` files are copied to the backup directory.

32.3 Changing Database Passwords

Novell ZENworks Server Management allows you to access the topology/alarm database at three different levels: Administrator account, Updater account, and Reader account. You can set passwords for any of the three different user accounts.

In Novell ConsoleOne, follow this procedure to modify the database passwords:

- 1 Right-click the Site Server object > select *Properties*.
- 2 Select the *Change Database Passwords* tab.
- 3 Enter the new passwords and confirm.
- 4 Click *Apply*.

Novell ZENworks Server Management sends a remote SQL command to change the passwords of appropriate user objects in the database. The passwords are also stored in the Novell eDirectory

32.4 Emptying the Database

Novell ZENworks Server Management enables you to empty the current database you are using and use a fresh database. The database files that you are using currently are located in the `novell zenworks\mms\db` directory. To empty the database:

- 1 Select all the files from the `novell zenworks\mms\emptydb` directory.
- 2 Copy all the files from the `novell zenworks\mms\emptydb` directory to the `novell zenworks\mms\db` directory.

Using Reports in Management and Monitoring Services

The Novell ZENworks® Server Management Management and Monitoring Services provide the following predefined reports:

- ♦ Topology Reports
- ♦ Alarm Reports
- ♦ Health Reports

The following sections describe the available reports and provide procedures for customizing and generating the reports:

- ♦ [Section 33.1, “Understanding Management and Monitoring Services Reports,” on page 1151](#)
- ♦ [Section 33.2, “Managing Reporting,” on page 1157](#)

33.1 Understanding Management and Monitoring Services Reports

The following sections describe each predefined report available in Management and Monitoring Services:

- ♦ [Section 33.1.1, “About the Topology Reports,” on page 1151](#)
- ♦ [Section 33.1.2, “About the Alarm Reports,” on page 1154](#)
- ♦ [Section 33.1.3, “About the Health Reports,” on page 1155](#)

33.1.1 About the Topology Reports

The topology reports provide information about the topology of a selected Novell ZENworks Server Management Site, segment or custom atlas container. The site-level reports provide details about the discovered devices on each segment in the Novell ZENworks Server Management site. The segment-level reports provide information about the discovered devices on the selected network segment. The custom atlas container report provides information about the computer system in the select container.

Prior to generating the reports, you will need to perform a few operations. For more information see [“Prerequisites for Generating the Reports” on page 1152](#).

There are five predefined topology reports:

- ♦ [“Computer Systems by Segment Report” on page 1152](#)
- ♦ [“NCP Servers Report” on page 1153](#)
- ♦ [“Router Report” on page 1153](#)
- ♦ [“Segment Report” on page 1153](#)
- ♦ [“Segment Topology Report” on page 1153](#)

NOTE: The NCP Servers report is available only at the site level.

The Custom Atlas reports list information of nodes in the current container from which Reporting has been launched, and not of the nodes contained in the sub-level containers.

Prerequisites for Generating the Reports

Because Crystal Reports is invoked by DLLs on the system, you need to install the Sybase ODBC driver. To check if the driver is installed:

- 1** From the desktop *Start* menu, click *Settings > Control Panel > ODBC Data Source*.
 - 1a** In the *System Data Source Name (DSN)* pane, click *Add*.
 - 1b** Select the Adaptive Server Anywhere driver. You must install Adaptive Server Anywhere if you do not have it on your system. You can install it from the `sybase.zip` file at `companioncd\odbc\sybase*.*`
- 2** If you have an older version of Novell ZENworks Server Management, you will need to uninstall it and install the latest version of Novell ZENworks Server Management before you can run the reports.

To uninstall the previous version:

- 2a** From the desktop *Start* menu, click *Settings > Control Panel > Add/Remove Programs*.
- 2b** Select *Novell ConsoleOne* from the list and remove it.

If you have already installed the latest version, then delete the `zensnapins.jar` file from `novell consoleone\lib\zen`.
- 3** You will need at least MDAC 2.6 SP1 (Microsoft Data Access Component) for running Crystal Reports, particularly on a Windows machine. Check the version of MDAC on your box: select *Control panel > ODBC Data sources > the About* tab. The minimum version required is 3.520.7326.0. If the version you have does not match the minimum requirement, you need to upgrade the ODBC core components by downloading from [Microsoft Download Center \(http://www.microsoft.com/downloads/\)](http://www.microsoft.com/downloads/).

Computer Systems by Segment Report

This report lists the number of computer systems on the selected segment. If the report is generated at the site level, the report lists the number of systems on each segment. For each segment, the report provides the following information about each connected computer system:

- ◆ Segment Name
- ◆ Segment Type
- ◆ Total nodes on a segment
- ◆ Node Name
- ◆ Node Address
- ◆ Services
- ◆ MIBs

NCP Servers Report

This report lists the following information for each server on the selected Novell ZENworks Server Management site:

- ◆ Server Name
- ◆ Total NCP servers on the site
- ◆ Server Label
- ◆ Server Address
- ◆ Labels (other names by which the server is known)
- ◆ MIBs

Router Report

This report provides the following information for each router on the selected Novell ZENworks Server Management segment or site:

- ◆ Total number of routers on the segment or site
- ◆ IPX Address
- ◆ Bound Segments
- ◆ Services
- ◆ MIBs
- ◆ IP Address
- ◆ MAC Address

Segment Report

This report lists the number of computer systems on the selected segment (segment level) or on all segments in the Novell ZENworks Server Management site (site level). For each segment, the report provides the following information about the systems connected to the segment:

- ◆ Segment Name
- ◆ Segment Type
- ◆ Total segments on the site
- ◆ IP configuration
- ◆ IPX configuration
- ◆ Total nodes on the segment

Segment Topology Report

This report provides information about the routers and bridges on a selected Novell ZENworks Server Management segment or site.

For each router, the report provides the following information:

- ◆ Router Name
- ◆ IP Address

- ◆ IPX Address
- ◆ MAC Address
- ◆ Bound Segment

For each bridge, the report provides the following information:

- ◆ Bridge Name
- ◆ Bridge Type
- ◆ Number of Ports
- ◆ Port: MAC Address and Bound Segment

33.1.2 About the Alarm Reports

The alarm reports provide information about the alarms received by the Novell ZENworks Server Management server. There are two types of alarm reports you can generate: Alarm details report and Alarm summary report.

This section provides information on the following topics:

- ◆ [“Prerequisites for Generating the Reports” on page 1154](#)
- ◆ [“Alarms Details Report” on page 1154](#)
- ◆ [“Alarms Summary Report” on page 1155](#)
- ◆ [“Available Trap Information Report on Site” on page 1155](#)

NOTE: The Custom Atlas reports the alarm information from the nodes in the current container only on which Reporting has been launched, and not of the alarms from the nodes contained in the sub-level containers.

Prerequisites for Generating the Reports

Because Crystal Reports is invoked by DLLs on the system, ensure that you have installed the Sybase ODBC driver. For more information, see [“Management and Monitoring Services Installation”](#) in the *Novell ZENworks 7 Server Management Installation Guide*.

Alarms Details Report

This report lists Information of the alarms on the site. The report is generated based on the customized settings. The report provides the following information about each connected computer system:

- ◆ Alarm Severity
- ◆ Affected object name
- ◆ Source address
- ◆ Alarm state
- ◆ Alarm category
- ◆ Alarm generator
- ◆ Alarm time

- ◆ Alarm owner
- ◆ Alarm type
- ◆ Alarm summary

Alarms Summary Report

This report generates a brief summary of the alarms on the site. It provides a graphical representation of the distribution of alarms, for the selected number of days. The report provides the following information about each connected computer system:

- ◆ Alarm Severity
- ◆ Alarm Category
- ◆ Alarm Owner
- ◆ Alarm state
- ◆ Top alarm types
- ◆ Top affected objects
- ◆ Top source address

Available Trap Information Report on Site

The Available Trap Information report lists the information of the SNMP traps currently available on the site server. The report is generated based on the MIBs compiled on the site server and provides the following information:

- ◆ Total traps
- ◆ Alarms category
- ◆ Alarm severity
- ◆ Alarm type
- ◆ Trap OID
- ◆ Trap description

33.1.3 About the Health Reports

The Health Reports provide information about the overall health of a specified Novell ZENworks Server Management site or network segment. Each health report is based on a predefined health profile. The health profiles define the trend parameters that are used to calculate the overall health of the segment or site. There are five predefined health profiles:

- ◆ [“Novell NetWare Server Profile” on page 1156](#)
- ◆ [“Microsoft Windows Profile” on page 1156](#)
- ◆ [“Ethernet Network Profile” on page 1156](#)
- ◆ [“Token Ring Network Profile” on page 1156](#)
- ◆ [“FDDI Network Profile” on page 1157](#)

In addition, you can modify any of the existing profiles or create your own health report profiles. See [“Customizing a Health Profile” on page 1158](#) or [“Adding a New Health Profile” on page 1158](#).

Novell NetWare Server Profile

Reports generated using this profile provide graphs of the following trend parameters and use these parameters to calculate the overall health of the Novell NetWare servers in the selected atlas, segment, or page:

- ◆ Cache Buffers
- ◆ Cache Hits
- ◆ CPU Utilization
- ◆ Volume Free Space

Microsoft Windows Profile

Reports generated using this profile use the following trend parameters to calculate health:

- ◆ Cache Hits
- ◆ CPU Utilization
- ◆ Disk Free Space
- ◆ Available Memory

In addition, reports generated using this profile contain trend graphs for the following parameter:

- ◆ Logged in Users

Ethernet Network Profile

Reports generated using this profile use the following trend parameters to calculate overall health:

- ◆ Total Errors
- ◆ Network Utilization

In addition, reports generated using this profile contain trend graphs for the following parameters:

- ◆ CRC error packets
- ◆ Undersized packets
- ◆ Oversized packets
- ◆ Fragmented packets
- ◆ Jabbers

Token Ring Network Profile

Reports generated using this profile use the following trend parameters to calculate overall health. In addition, reports generated using this profile also contain trend graphs for the following parameters:

- ◆ Network Utilization
- ◆ Total Errors

FDDI Network Profile

Reports generated using this profile use the following trend parameters to calculate overall health:

- ♦ Total Errors
- ♦ Network Utilization

In addition, reports generated using this profile contain trend graphs for the following parameters:

- ♦ CRC error packets
- ♦ Undersized packets
- ♦ Oversized packets
- ♦ Lost frame errors

33.2 Managing Reporting

The following sections provide procedures for customizing, generating, printing, and exporting the Novell ZENworks Server Management reports:

- ♦ [Section 33.2.1, “Managing the Topology Reports,” on page 1157](#)
- ♦ [Section 33.2.2, “Managing the Server Management Health Reports,” on page 1157](#)

33.2.1 Managing the Topology Reports

You can generate two types of topology reports: site-level reports and segment-level reports. The site-level reports provide details about the discovered devices on each segment in the Novell ZENworks Server Management site. The segment-level reports provide information about the managed devices on the selected network segment. Note that the NCP Servers report is available only at the site level.

The following section describes how to generate, print, and export a topology report.

Generating a Topology Report

To generate a topology report:

- 1 Select the Novell ZENworks Server Management site object, a network segment object, or a Custom Atlas container object.
- 2 Click *Tools > Reports*.
- 3 Select the report you want to generate, then click *Run Selected Report*.
- 4 To print the report, click .
- 5 To export the report, click .

33.2.2 Managing the Server Management Health Reports

The server management component provides five standard profiles that you can use to generate health reports. You can set up reports based on these standard profiles or you can customize these profiles or create your own profiles on which to base your reports. For information about the standard health profiles, see [“About the Health Reports” on page 1155](#).

This section contains the following tasks:

- ♦ [“Customizing a Health Profile” on page 1158](#)
- ♦ [“Adding a New Health Profile” on page 1158](#)
- ♦ [“Creating and Scheduling Health Reports” on page 1159](#)
- ♦ [“Editing, Scheduling, and Deleting Health Reports” on page 1159](#)
- ♦ [“Viewing and Printing a Health Report” on page 1160](#)
- ♦ [“Running a Health Report” on page 1161](#)
- ♦ [“Calculating the Overall Health” on page 1161](#)

Customizing a Health Profile

To customize a health profile:

- 1 Right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Select the *Health Profiles* tab.
- 3 Select the health profile you want to customize, then click *Edit*.
The Edit Profile dialog box is displayed. This dialog box contains a list of the parameters that can be used to calculate the overall health of the device or segment to which the profile is applied.
- 4 Specify the directory location to which reports generated using this profile should be published by entering a value in the Publish Directory field.
To browse for a directory, click the *Browse* button (...).
- 5 Modify the parameters that are used to calculate health by checking or unchecking the *In Health Calculation* check box next to each parameter. For more information on the parameters that are used in health calculation see, [“About the Health Reports” on page 1155](#).
- 6 Rank the importance of each trend parameter in calculating health by entering a number in the Weight field for each parameter you checked to include in the health calculation.
You can enter any whole number in the Weight field. The system will use the weights to determine how important the parameter is in calculating overall health. The larger the number, the more weight the parameter is given in calculating health.
- 7 Modify which parameters to render graphically in the health report by checking or unchecking the Show Trend on Report check box next to each parameter.
- 8 To save your changes, click *OK*.

Adding a New Health Profile

To add a new health profile:

- 1 Right-click the Novell ZENworks Server Management site object, then click *Properties*.
- 2 Select the *Health Profiles* tab.
- 3 Click *New*.
The New Profile dialog box is displayed.
- 4 Enter a name for the new profile in the *Name* field.

- 5 Select the type of device or segment to which the profile applies from the *Type* drop-down list then click *OK*.
The Edit Profile dialog box is displayed.
- 6 Specify the directory location to which reports generated using this profile should be published by entering a value in the *Publish Directory* field.
To browse for a directory, click the *Browse* button (...).
- 7 Select the parameters you want to use to calculate health for reports generated using this profile by clicking the *In Health Calculation* check box next to the appropriate parameters. For more information on the parameters that are used in health calculation see, “[About the Health Reports](#)” on page 1155.
- 8 For each parameter you selected to include in the health calculation, indicate how important the parameter is in calculating overall health by entering a value in the *Weight* column.
You can enter any whole number in the *Weight* field. The system will use the weights to determine how important the parameter is in calculating overall health. The larger the number, the more weight the parameter is given in calculating health.
- 9 For each parameter that you want to be represented graphically in associated health reports, click the *Show Trend on Report* check box.
- 10 Click *OK*.

Creating and Scheduling Health Reports

To create and schedule a health report:

- 1 Right-click the container object, then click *Properties*.
- 2 Select the *Health Reports* tab.
- 3 Click *New*.
The Edit Report dialog box is displayed.
- 4 Enter a name for the report in the *Name* field.
- 5 Select the profile to use when generating the report by selecting a value from the *Profile* drop-down list.
- 6 Indicate how often you want to generate the reports by selecting a value from the *Period* drop-down list.
You can choose to generate reports daily, weekly, or monthly.
- 7 Set the time and date you want the reports generated by selecting or entering the appropriate values in the *Start Time*, *Day of the Week*, and/or *Day of the Month* fields.
The available fields will depend on the period you selected.
- 8 Click *OK*.
The report will be generated at the date and time you entered and stored in the directory specified in the associated report profile. For information on viewing the reports, see “[Viewing and Printing a Health Report](#)” on page 1160.

Editing, Scheduling, and Deleting Health Reports

To edit and schedule a health report:

- 1 Right-click the atlas, page, or segment, then click *Properties*.

2 Select the *Health Reports* tab.

3 Click *Edit*.

The Edit Report dialog box is displayed. Edit the required information

4 Click *OK*.

IMPORTANT: If you want to edit the schedule time of the report, it is recommended that you create a new report with the changed schedule time or delete the report.

To delete a health report:

1 Right-click the atlas, segment, or page, then click *Properties*.

2 Select the *Health Reports* tab.

3 Click *Delete*.

4 Click *OK*.

Viewing and Printing a Health Report

After you create a health report, the report will be automatically generated on the day and time you specified. You can view the reports using a Web browser to open the `index.htm` file in the directory that is designated as the publish directory in the associated report profile.

IMPORTANT: Before you can view the health reports, you must install the Java plug-in 1.3.1_01 or higher version, except the 1.4.0 series. You can obtain this plug-in from Sun Microsystems, Inc.

To view a health report:

1 Browse to the directory where the health reports for the associated profile are stored.

2 Use your browser to open the `index.htm` file.

The `index.htm` file is a Java file containing all reports that are stored in the directory. The left column of the `index.htm` file lists report hierarchy.

3 Click the plus sign next to the profile that is associated with the reports you want to view.

The profile object expands to display a list of container objects.

4 Click the plus sign next to the container object associated with the reports you want to view.

The object expands to display a list of report names associated with the object.

5 Click the plus sign next to the report you want to view.

The object expands to display a list of individual report instances. For example, a report that is scheduled to run daily will have a report instance for each day. The reports are named by date and time. For example, `2000.09.09_11.15.10_PDT` is the name assigned to a report generated on September 9, 2000 at 11:15:10 Pacific daylight time.

6 Click the plus sign next to the report name to display a list of individual report pages.

The number of individual report pages depends on what report profile you selected and the object where you generated the report. For example, if you generated a report at the segment level using the Ethernet Network profile, there will only be one report page for the segment. If you generated a report at the site level using the Ethernet Network profile, there will be a report

page for each Ethernet segment within the site. If you generated a report at the segment level using the Novell NetWare Server profile, there will be a separate report page for each Novell NetWare server on the segment.

- 7 Click an individual report page to display the health report in the right frame.

The top of the report displays statistical information about the segment or server and provides a calculation of overall health. The parameters used to determine overall health are defined in the associated health report profile. The bottom of the profile displays trend graphs depicting the overall performance of the server or segment. See [“About the Health Reports” on page 1155](#) for a list of the parameters tracked and graphed in each of the standard profiles.

- 8 To print the report, click the *Print Report* button at the bottom of the left frame.

Running a Health Report

Although Health Reports are usually scheduled to run at a specified time of the day, week, or month, you may occasionally want to generate a Health Report on demand. To generate a Health Report on demand:

- 1 Right-click the atlas, segment, or page, then click *Properties*.
- 2 Select the *Health Reports* tab.
- 3 Select the report you want to generate, then click *Now*.

The report is saved to the directory specified in the report profile. See [“Viewing and Printing a Health Report” on page 1160](#).

Calculating the Overall Health

Overall health is calculated using the following parameters:

- ♦ Attributes selected for health calculation.
- ♦ Associated weights assigned to each attribute.
You can only associate weights, which are used for health calculations.
- ♦ Values for each attribute
Yellow threshold (YT), Red threshold (RT), and maximum value (maxValue).
- ♦ Global threshold values
Global Green threshold (GG) is 100, Global Yellow threshold (GY) is 66, and Global Red threshold (GR) is 33.

Health Calculation

For each of the attribute used in overall health calculation, sample values based on the schedule specified while generating the reports are collected. These sample values are normalized using global thresholds and attribute thresholds, where Global Green is 100, Global Yellow is 66, and Global Red is 33. The global Green range = global Green - global Yellow; the global Yellow range = global Yellow - global Red; and the global Red range = global Red.

Normalization Formula

Normalized Value = Global Threshold - ((value - attribute Threshold)/(attribute Threshold Range) * (Global Range))

if (value > attribute's RED threshold)
 global Threshold = global Red
 attribute threshold = attribute Red threshold
 attribute threshold range = attribute maxValue - attribute Red threshold
 global Range = global Red range
 if (value > attribute's Yellow threshold)
 global threshold = global Yellow
 attribute threshold = attribute Yellow threshold
 attribute threshold range = attribute Red - attribute Yellow
 global range = global Yellow range
 if (value > 0)
 global threshold - ((value)) / (attribute threshold range) * (global range)
 global threshold = global Green
 attribute threshold Range = attribute Yellow threshold
 global range = global Green range

Each of these may have an associated weight attached to it, which is configured in the respective profiles. Each of these attribute samples is then multiplied by the corresponding weights using the formula:

value = value * attributeWeight / TotalWeight;

where — value is the particular sample after normalization, attributeWeight is the weight associated with the attribute and the TotalWeight is the total weight of all the attributes used in health calculation.

The other values displayed in Health Reports are based on the following calculations:

- ◆ Minimum Value = minimum of all the values in a given sample
- ◆ Maximum Value = Maximum value of all the values in a given sample
- ◆ Average Value = Sum of all the Values / no of Samples
- ◆ Trend is calculated based on the Slope:

$$\text{Slope} = (n * \sum x * y - \sum x * \sum y) / (n * \sum x * x - \sum x * \sum x)$$

where:

n = number of samples

x = time at which these samples were captured

y = trend values

if Slope > 0, then the trend is increasing

if Slope < 0, then the trend is decreasing

if Slope = 0, then the trend is steady

- ◆ Intercept = ($\sum y$ - Slope * $\sum x$) / n

- ◆ Next Week Projection or Next Month Projection Value = Slope * time + Intercept
where time = Report Schedule Time (time when the report was scheduled) + 7 * 24 * 60 * 60 * 1000 for weekly Projection
- ◆ Report Schedule Time (time when the report was scheduled) + 30 * 24 * 60 * 60 * 1000 for Monthly Projection.

WARNING: Exporting data in CSV (Comma Separated Value), Character Separated Value, and Tab Separated Value (TSV), does not export the complete data. As a workaround you need to first export data in MS Excel format and then save it in the desired format.

If you export the generated reports in formats other than HTML or DHTML, the correct page numbers are not displayed. The page number is displayed incorrectly as Page -1 of 1, for all pages.

Using SNMP Community Strings

This chapter is referenced from the other sections. This section provides you information on SNMP, the SNMP community strings and how to configure SNMP community strings.

This section contains the following information:

- ♦ [Section 34.1, “About SNMP Community Strings,” on page 1165](#)
- ♦ [Section 34.2, “Setting the SNMP Community Strings,” on page 1166](#)

34.1 About SNMP Community Strings

SNMP is a protocol that offers network management services within the Internet suite of protocols.

SNMP uses a lightweight security mechanism whereby each protocol data unit (PDU) contains a community string. The SET community string is used in an SNMP Control operation and the GET community string is used in an SNMP Monitor operation.

SNMP community strings provide only a rudimentary form of security because they are transmitted in clear text in each SNMP request. Therefore, the community strings are exposed to any stations capable of monitoring an IP or Internetwork Packet Exchange™ (IPX™) network

Because Management Agent for Novell NetWare and Management Agent for Windows are based on SNMP, all actions that are directed from network Novell ConsoleOne to a server involve SNMP SET and GET requests from the manager to the agent. Novell ConsoleOne® requests data from a managed server by issuing an SNMP GET request. An SNMP SET command is required to set server alarm thresholds or configuration parameters. In most cases, you are unaware of the underlying SNMP commands required to carry out requests you make in Novell ConsoleOne, unless you are issuing requests on an SNMP-enabled device through the MIB Browser.

34.1.1 SNMP Security

Conducting management operations from Novell ConsoleOne raises the issue of ensuring security. In particular, if unauthorized users configuration parameters on a server, performance problems or even sabotage network operations are encountered.

For these reasons, you should establish a scheme for changing the default community string PUBLIC to a proprietary community string used for communication between the management system and your SNMP agents.

Use the community keyword to define the community string to be used in the generated traps. The length of the community string is restricted to 32 bytes and cannot contain a space (except between quotes), tab, square bracket, equals sign, colon, semicolon, or number sign (#) characters. You can use Unicode* or International characters for the community string.

The default community string for Monitor operations is PUBLIC and for Control operations is null.

34.2 Setting the SNMP Community Strings

This section provides the following information:

- ♦ [Section 34.2.1, “Setting the SNMP Community String: Novell NetWare Server,” on page 1166](#)
- ♦ [Section 34.2.2, “Setting the SNMP Community String: Novell ConsoleOne,” on page 1168](#)
- ♦ [Section 34.2.3, “Setting Community Strings for an Individual Node,” on page 1168](#)
- ♦ [Section 34.2.4, “Setting the SNMP Community String: Windows,” on page 1169](#)

34.2.1 Setting the SNMP Community String: Novell NetWare Server

You configure security access for SNMP communications using either SNMP LOAD command line parameters (Novell NetWare 3.x/4.x/5.x/6 servers) or through INETCFG (Novell NetWare 4.x/5.x/6 servers, or servers with Novell NetWare MultiProtocol Router™ software installed).

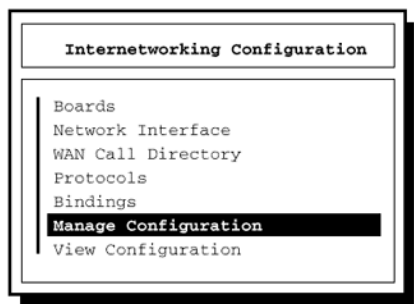

The following sections contain additional information to help you configure your Novell NetWare servers:

- ♦ [“Configuring Community String Options Using INETCFG” on page 1166](#)
- ♦ [“Configuring Community String Options Using SNMP LOAD Commands” on page 1167](#)

Configuring Community String Options Using INETCFG

To configure the community string options using INETCFG:

- 1 At the server prompt, enter `LOAD INETCFG`.

- 2 From the Internetworking Configuration menu, click *Manage Configuration > Configure SNMP Parameters > Monitor State*.
- 3 Select one of the following options:

These options let you indicate how SNMP handles SNMP read operations coming from outside this server.

Option	Description
<i>Any Community May Read</i>	Allows all GET (read) commands no matter what community string is provided in the incoming read request.

Option	Description
<i>Leave as Default Setting</i>	Avoids changing the Monitor community string from its default (which is usually PUBLIC). The default Monitor Community can still be changed manually through SNMP command line options, as described in “Configuring Community String Options Using SNMP LOAD Commands” on page 1167 .
<i>No Community May Read</i>	Allows GET (read) commands only for requests that are made by Novell ConsoleOne that have logged in to the server with SUPERVISOR or OPERATOR privileges. Any community string provided in an incoming read request is ignored.
<i>Specified Community May Read</i>	Allows only GET (read) commands for requests that contain the name specified in the Monitor Community field. If you selected this option, enter a name in the Monitor Community field, then press Enter. Enter the name of the community that is allowed to read management information. SNMP management stations that belong to this community can read the network management database.

4 Press Enter.

To change the Control community options, repeat Step 1 to Step 4 and choose the appropriate options for the community strings.

5 When you are finished, press Esc. If prompted, click *Yes* to save changes to the SNMP parameters, then press Enter.

6 To return to the Internetworking Configuration menu, press Esc.

7 To exit INETCFG, press Esc.

8 Re-initialize the system.

To re-initialize, at the server prompt, enter `reinitialize system`.

Configuring Community String Options Using SNMP LOAD Commands

The LOAD command accepts the following SNMP option parameters:

- ♦ **MonitorCommunity:** Sets the community string for read-only (GET) access. The default value is PUBLIC. The syntax is as follows:

```
LOAD SNMP MonitorCommunity=community_name
```

- ♦ **ControlCommunity:** Sets the community string for read and write (GET and SET) access. By default, this community string is disabled.

The syntax is as follows:

```
LOAD SNMP ControlCommunity=community_name
```

These options set the community string for the indicated community.

The following table shows examples of available settings:

IMPORTANT: Community strings are case sensitive.

Access Available to Requester	Read Only	Read/Write
Community name: "secret"	Load SNMP MonitorCommunity= <i>secret</i>	LOAD SNMP ControlCommunity= <i>secret</i>
	or	
	LOAD SNMP ControlCommunity= <i>secret</i>	
Community name: "str1" or "str2"	Load SNMP MonitorCommunity= <i>str1</i>	
	and	
	LOAD SNMP ControlCommunity= <i>str2</i>	
Any community name	Load SNMP MonitorCommunity=""	LOAD SNMP ControlCommunity=""
	or	
	LOAD SNMP ControlCommunity=""	

34.2.2 Setting the SNMP Community String: Novell ConsoleOne

You set global community and trap target information using the SNMP property page associated with the site-level object. You can also customize the setting for a specific device using the SNMP property page of the device itself.

34.2.3 Setting Community Strings for an Individual Node

This section describes the procedure to set up the community strings for SNMP SET and GET operations on an individual node.

Typically, community strings are configured to be identical over all nodes in a network, or at least over a portion of the network. The default value for both SET and GET is public. The community strings are case sensitive.

By default, Novell ZENworks Server Management uses the public community string for SNMP GET and SET operations. You can configure a community string other than public on a node-by-node basis, or you can configure a community string globally on all SNMP-managed nodes. The community string that Novell ZENworks Server Management uses must match the string expected by the SNMP agent in the managed node; otherwise, the operation will fail.

To set up the community strings for SET and GET operations for an individual node:

- 1 In Novell ConsoleOne, click the target SNMP-manageable node.
- 2 Right click the node, then click *SNMP Settings*.
- 3 Enter the community string.

Novell ZENworks Server Management uses this community string for SET and GET operations when communicating with the device.

- 4 Click *OK*.

34.2.4 Setting the SNMP Community String: Windows

You configure security access for SNMP communications on Windows servers using the Network applet in the Windows Control Panel. For detailed information, refer to your Windows documentation or online help.

You must load the Microsoft* SNMP Service on your Windows servers. The SNMP community string setting must be the same as the SNMP community string setting on your Novell ConsoleOne.

Understanding the View Builder

The View Builder provides a mechanism through which you can create a view to display information from the agents that have instrumented SNMP MIBs and traps sent by the agent to the Management Site Server. You can use the View Builder to create views in addition to those available in Novell ConsoleOne. These views are displayed as text, tables and graphs.

You can associate the views to specific nodes and manage them.

To launch the View Builder dialog box:

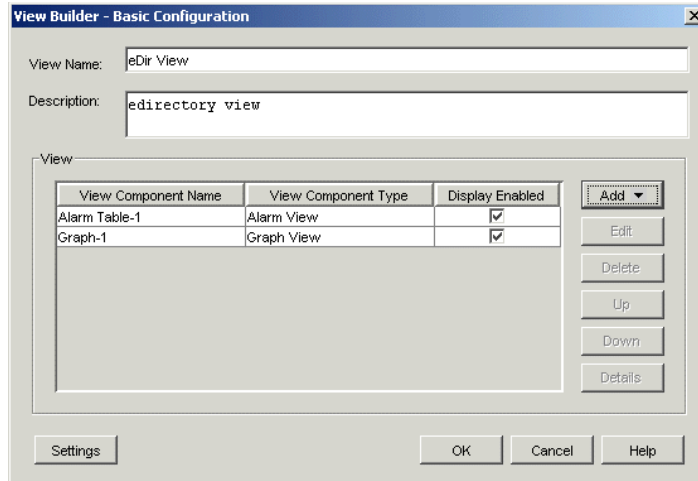

- 1 In Novell ConsoleOne, select *Tools > View Builder*.

- ◆ **Defined Views:** Lists the views created.
- ◆ **View Name:** The name of the view.
- ◆ **Description:** The description of the view.
- ◆ **Add:** Click . Launches the Basic Configuration dialog box. You can create the view components in this dialog box.
- ◆ **Edit:** Click to edit the view details.
- ◆ **Delete:** Click to delete the view.
- ◆ **Export:** Click to export a view to a file.
- ◆ **Import:** Click to import a view from a file.

- 2 In the View Builder dialog box, click .

The View Builder - Basic Configuration dialog box is displayed.

A view can contain view components or a combination of view components. The view components you can create are: Name-Value Pairs view, Alarm View, Table View, and Graph View.

3 Perform any of the following operations:

- ♦ [Section 35.1, “Creating a Name-Value Pairs View Component,” on page 1172](#)
- ♦ [Section 35.2, “Creating an Alarm View Component,” on page 1174](#)
- ♦ [Section 35.3, “Creating a Table View Component,” on page 1175](#)
- ♦ [Section 35.4, “Creating a Graph View Component,” on page 1176](#)
- ♦ [Section 35.5, “Setting the Criteria for the View to Appear,” on page 1178](#)

4 Click *OK*.

35.1 Creating a Name-Value Pairs View Component

The Name-Value Pairs view component can consist of multiple name-value pairs.

1 In the View Builder - Basic Configuration dialog box, click *Add > Name-Value Pairs View*.

2 Specify the *Name-Value Pairs View* name.

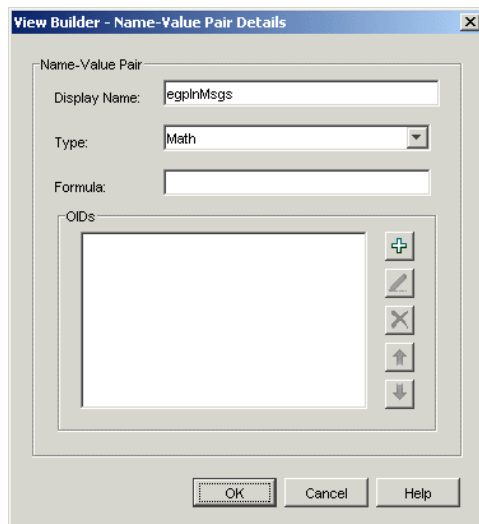

The *Name-Value Pairs* box contains a tabular list of all the view components you have created. The Name and the Value Source of the view component you created are displayed.

3 Perform any of the following operations:

- ♦ **Add Multiple:** To add multiple name-value pairs, click .
- ♦ **Add:** To add a name-value pair, click .
- ♦ **Edit:** To modify the information, select the name-value pair you want to edit from the Name-Value Pairs list, then click .
- ♦ **Delete:** To delete a name-value pair, select it from the Name-Value Pairs list, then click .
- ♦ **Arrange Order:** Use  or  to change the order of display.

35.1.1 Adding a Name-Value Pair

1 In the Name-Value Pairs View Configuration dialog box, click .

2 Specify the display name of the name-value pairs component.

3 From the drop-down list, select the type of the name-value pair.

You can select *Name-Value Pair* type as *Simple*, *Rate*, or *Math*. If you select the type as *Rate*, you must specify OIDs of types GAUGE or COUNTER. If you select the type as *Math*, you must specify a formula.

Specifying a Formula: The OIDs listed in the table are numbered from 0,1,2 and so on. They are preceded by the data identifiers *v*, the current value of the OID; and *h*, indicating the previous value of the OID. You can use +, -, /, *, ^, () operands when you specify your formula. You can also use constants in your formula.

For example: Select the OIDs snmpInPkts (1.3.6.1.2.1.11.1) and snmpOutPkts (1.3.6.1.2.1.11.2). The formula can be $v0+v1$. The result will be the total number of SNMP packets handled by the transport service.

4 Click *OK*.

The name-value pair you created is displayed in Name-Value Pairs Configuration dialog box. Use the same procedure to add multiple name-value pairs, then Click *OK*. The Name-Value Pair view component is displayed in the Basic Configuration dialog box.

35.1.2 Editing the Name-Value Pairs View Component

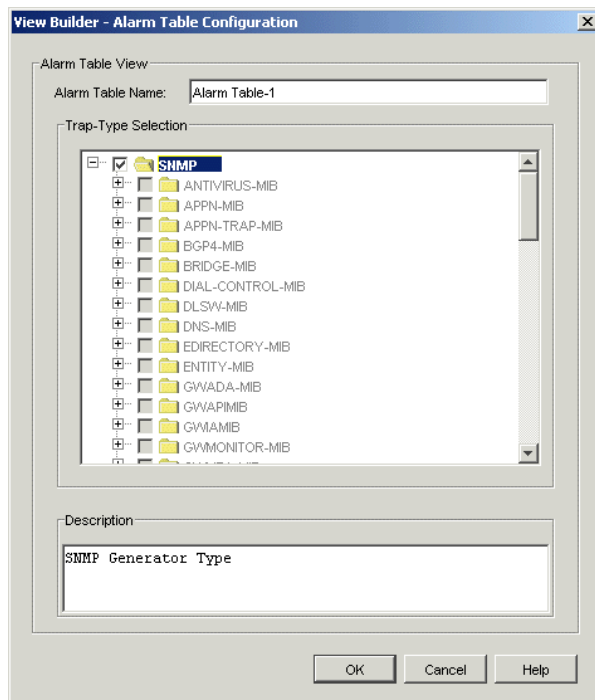

- 1 In the Basic Configuration dialog box, select the name-value pairs view component you want to modify, then click *Edit*.
- 2 Modify the name-value pairs component details, then click *OK*.

35.1.3 Deleting the Name-Value Pairs View

- 1 In the Basic Configuration dialog box, select the name-value pairs view component you want to delete.
- 2 Click *Delete*.

35.2 Creating an Alarm View Component

- 1 In the View Builder - Basic Configuration dialog box, click *Add > Alarms View*.

- 2 Specify the Alarm Table name.
- 3 Select a trap type.
You can select the trap type based on three hierarchies. You can select all the traps from the node, a particular category, or a specific trap type within a category.
- 4 Click *OK*.

The alarm view component you created is displayed in the Basic Configuration dialog box.

35.2.1 Editing the Alarms View Component

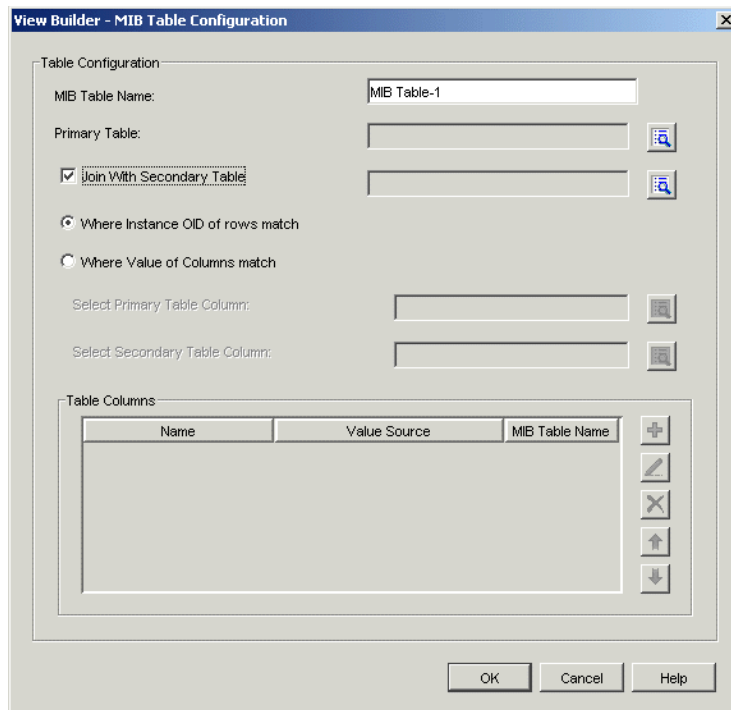

- 1 In the Basic Configuration dialog box, select the alarm view component you want to modify, then click *Edit*.
- 2 Modify the alarm view component details, then click *OK*.

35.2.2 Deleting the Alarm View Component

- 1 In the Basic Configuration dialog box, select the alarm view component you want to delete.
- 2 Click *Delete*.

35.3 Creating a Table View Component

- 1 In the View Builder - Basic Configuration dialog box, click *Add > Table View*.

- 2 Specify the MIB Table name.
- 3 Click  to select the MIB table that will be your primary table. Go to [Step 7](#).
- 4 Join the primary table with the secondary table.
- 5 Check the *Join With Secondary table* option if you want to join the primary and secondary table. Click  to select the secondary table.
- 6 Set the conditions to join the primary and secondary table

Where Instance OID of Rows Match: Joins the primary and the secondary table based on matching instance OIDs.

Often extension tables are created for standard tables. The extended table does not have an explicit index and uses the index of the standard table. For example, you can join the tables hrSWRunTable(1.3.6.1.2.1.25.4.2) and hrSWRunPerfTable (1.3.6.1.2.1.25.5.1).

Where Values of Columns Match: Joins the primary and the secondary table based on matching columns OIDs. You must select the primary table column and the secondary table column to meet this condition. Click  to select the Primary table column and the second table column.

For example, you can join the ifTable(1.3.6.1.2.1.2.2) and ipAddrTable(1.3.6.1.2.1.4.20) with the matching columns being ifIndex:1.3.6.1.2.1.2.2.1.1 from primary table and ipAdEntIfIndex 1.3.6.1.2.1.4.20.1.2 from the secondary table.

7 Under Table Columns perform any of the following operations:

- ◆ **Add:** To add a table column, click .
- ◆ **Edit:** To change the table column, click .
- ◆ **Delete:** To delete the table column, click .
- ◆ **Arrange Order:** Use  or  to change the order of display.

8 Click *OK*.

The table view component you created is displayed in the Basic Configuration View dialog box.

35.3.1 Editing an Table View

- 1** In the Basic Configuration dialog box, select the table view component you want to modify, then click *Edit*.
- 2** Modify the table view details, then click *OK*.

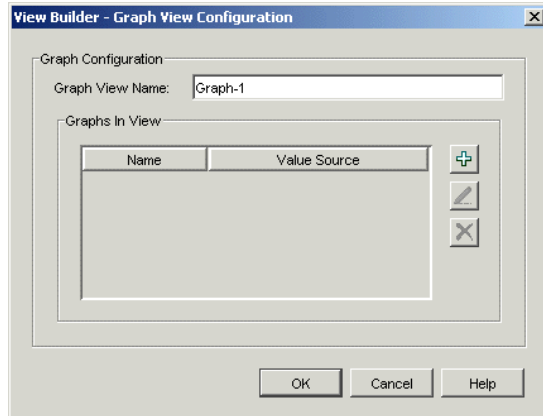

35.3.2 Deleting a Table View

- 1** In the Basic Configuration dialog box, select the table view component you want to delete, then click *Delete*.

35.4 Creating a Graph View Component

The graphs you want to add to the graph view are displayed based on the trend data collected by the Advanced Trending Agent running on a particular node. Use the following procedure to create graphs:

- 1** In the View Builder - Basic Configuration dialog box, click *Add*, then click *Graph View*.

- 2 Specify the graph view name.

35.4.1 Adding Graph Details

- 1 In the Graph View Configuration dialog box, click +.

- 2 Specify the display name of the graph.
- 3 The Advanced Trending Agent is selected because this is the trending agent the graph display is based on.
- 4 Click  to select the trend OID.

IMPORTANT: The OID you select must be trended by the Advanced Trending Agent.

- 5 Click *OK*

The graph you created will be displayed in the Graph View Configuration dialog box. Use the above procedure to add multiple graphs, then click *OK*. The Graph view component is displayed in the Basic Configuration dialog box.

35.4.2 Editing the Graph View Component

- 1 In the Basic Configuration dialog box, select the graph view component you want to modify, then click *Edit*.
- 2 Modify the graph details, then click *OK*.

35.4.3 Deleting the Graph View Component.

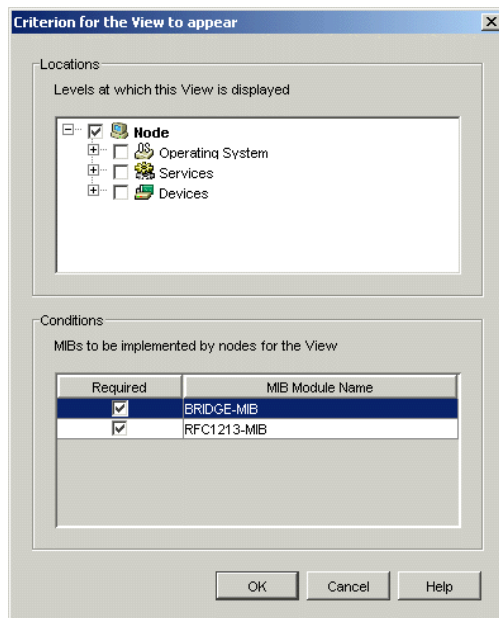

- 1 In the Basic Configuration dialog box, select the graph view component you want to delete.
- 2 Click *Delete*.

35.5 Setting the Criteria for the View to Appear

You can set a criterion for the view to appear on selected levels. The setting includes the location of the view and the condition for the view to appear.

To set the criterion for the view to appear:

- 1 In the Basic Configuration dialog box, click *Settings*.

- 2 Specify the location where you want the view to appear.
By default, the view you created appears at the node level.
- 3 Specify the condition for the view to appear.

The MIBs implemented by the node and the MIB Module name of the node where you want the view to be displayed are displayed in this list. By default, all the MIB modules are deselected for implementing on the node. If it is necessary for the MIB module to be implemented on a node, select the MIB module. The MIBs listed here will be automatically discovered by Discovery.

- 4 Click *OK*.

Understanding Trap Configuration

Novell® ZENworks® 7 Server Management provides the Trap Configuration tool to manage NetWare® Server Traps and Novell Directory Services® Traps in your network. Trap Configuration allows you to configure the Traps on the NetWare servers from a centralized management console.

The following sections provide you with the concepts and instructions to help you configure the Traps:

- ♦ [Section 36.1, “Understanding Trap Configuration,” on page 1179](#)
- ♦ [Section 36.2, “Configuring Traps Using Trap Configuration Page,” on page 1180](#)
- ♦ [Section 36.3, “Additional Trap Configuration Features,” on page 1183](#)

36.1 Understanding Trap Configuration

This section contains basic information to help you understand the ZENworks 7 Server Management Trap Configuration feature.

- ♦ [Section 36.1.1, “The Configuration Agents,” on page 1179](#)
- ♦ [Section 36.1.2, “Trap Configuration Management Console,” on page 1179](#)

36.1.1 The Configuration Agents

Trap Configuration allows you to configure Traps of NetWare Server Alarm MIB and Novell Directory Services MIB.

NetWare Server Alarm MIB Trap Configuration is managed by the `nwtrpagt.nlm` agent, which implements the `NWTRAPCONFIGURATION` MIB module.

The Novell Directory Services MIB Trap Configuration is managed by the `dstrpagt.nlm` agent, which implements the `NDSTRAPCONFIGURATION` MIB module.

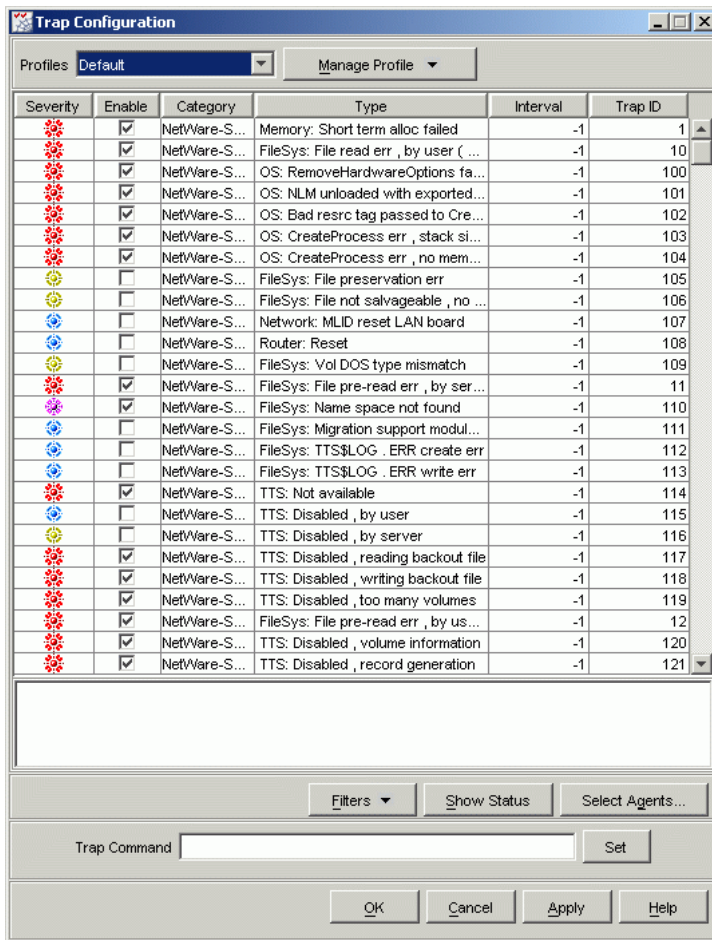

The `nwtrpagt.nlm` and `dstrpagt.nlm` agents implement a table for all the NetWare Server Alarm MIB Traps and Novell Directory Services MIB Traps. These tables are defined by `NWTRAPCONFIGURATION` MIB and `NDSTRAPCONFIGURATION` MIB. Each row in this table has an editable fields for Trap Status and Intervals. The number of rows are same as the number of Traps defined in NetWare Server Alarm MIB and Novell Directory Services MIB.

NOTE: You cannot create a row in this table.

36.1.2 Trap Configuration Management Console

You can use the Trap configuration management console to enable/disable and configure the Interval field for NetWare Server Traps and Novell Directory Service Traps, as illustrated in [Figure 36-1](#):

Figure 36-1 Trap Configuration dialog box

36.2 Configuring Traps Using Trap Configuration Page

Following are the tasks you can perform on the Trap Configuration Management Console using Trap Configuration page:

- ◆ [Section 36.2.1, “Enabling and Disabling the Traps,”](#) on page 1180
- ◆ [Section 36.2.2, “Changing the Interval of a Trap,”](#) on page 1181
- ◆ [Section 36.2.3, “Selecting NetWare Servers to Apply a Trap Configuration,”](#) on page 1181
- ◆ [Section 36.2.4, “Viewing the Trap Configuration Status,”](#) on page 1182
- ◆ [Section 36.2.5, “Using the Command Line Option,”](#) on page 1182

36.2.1 Enabling and Disabling the Traps

The Trap Configuration feature allows you to enable/disable Trap or a set of Traps. If you are accessing the Trap configuration of a NetWare server, the current configuration of a NetWare server is displayed; however if you are accessing the segment or atlas level, the default profile is displayed where Critical and Major Traps are enabled and Minor and Informational Traps are disabled.

To enable/disable the Traps:

- 1 In ConsoleOne, right-click the object under a Site Server object, then click *Actions*, then click *Trap Configuration*.
- 2 Select an option next to a Trap which you want to enable. When you select a row, the corresponding description is displayed in the bottom of the Trap Configuration dialog box.
You disable a Trap by deselecting the option.

NOTE: You must select the NetWare server where you want to enable or disable a Trap. For more details on selecting a NetWare server, refer to [Section 36.2.3, “Selecting NetWare Servers to Apply a Trap Configuration,” on page 1181](#)

36.2.2 Changing the Interval of a Trap

Trap Configuration allows you to change the Trap interval. An interval indicates the duration before the same Trap is generated again. Controlling the interval allows you to eliminate excess server traffic.

- 1 In ConsoleOne, right-click the object under a Site Server object, then click *Actions*, then click *Trap Configuration*.
- 2 Select a Trap for which you want to change the interval.
- 3 Double-click *Interval*.
- 4 Change the interval value according to your requirements.

NOTE: You can also change the Trap interval by using command line options. For more details on using command line options, refer to [Section 36.2.5, “Using the Command Line Option,” on page 1182](#)

36.2.3 Selecting NetWare Servers to Apply a Trap Configuration

You need to select a NetWare server or a set of NetWare servers to apply a configuration on it.

- 1 In ConsoleOne, right-click the object under a Site Server object, then click *Actions*, then click *Trap Configuration*.
- 2 Click *Select Agents*.
- 3 In Select Node View dialog box, click *Add*.
- 4 In Select Object dialog box, select the NetWare servers on which you want to apply the configuration.

NOTE: You can select more than one NetWare server by pressing Ctrl and selecting the servers you want to include.

To remove NetWare server, select the agent from the Select Node View dialog box, then click *Remove*.

- 5 Click *OK*. The IP address of the selected NetWare server is displayed in the Select Node View dialog box.

- 6 Click *OK*, then click *Apply*.

The selected Trap configuration is applied on the listed NetWare servers.

36.2.4 Viewing the Trap Configuration Status

- 1 In ConsoleOne, right-click the object under a Site Server object, then click *Actions*, then click *Trap Configuration*.
- 2 Click *Show Status*.

The status of previous configuration operation is displayed in the Configuration Status dialog box.

NOTE: To refresh the status, click *Refresh* or Press F5. If you have selected multiple servers, Trap Configuration might take some time to refresh the status.

36.2.5 Using the Command Line Option

Trap Configuration allows you to specify a command to:

- ♦ Enable/disable the Traps
- ♦ Set up an interval for the Traps

You can use various operators like =, >, <, >=, <= to work with Trap commands. For example, if you want to enable all NetWare server Traps with an ID of more than 20, type following in the Trap Command field:

```
nwTrap enable ID>20
```

The following table lists and explains the text or string you can specify in the *Trap Command* field:

Text or String	Result
nwtrap enable all	Enables all NetWare traps.
nwtrap enable ID > 20	Enables all NetWare traps with an ID greater than 20.
nwtrap enable severity < critical	Enables those NetWare traps that have a severity that is less than Critical. You can also use numbers to represent a severity. For example, you can use 4 for Critical and 3 for Major.
nwtrap all interval 20	Sets the interval as 20 for all NetWare traps.
nwtrap 1-20 interval 10	Sets the interval as 10 for the first 20 traps.
nwtrap 1 2 3 interval 15	Sets the interval as 15 for the first three NetWare traps.

NOTE: In the above table, nwtrap stands for NetWare server Traps. You can use similar commands for Novell Directory Services Traps by using ndstrap instead of nwtrap. For example, ndstrap enable all enables all Novell Directory Services Traps.

36.3 Additional Trap Configuration Features

ZENworks Server Management Trap Configuration also includes the following features:

- ♦ [Section 36.3.1, “Filtering the Traps,” on page 1183](#)
- ♦ [Section 36.3.2, “Sorting the Traps,” on page 1184](#)
- ♦ [Section 36.3.3, “Managing Profiles,” on page 1184](#)
- ♦ [Section 36.3.4, “Viewing Current Configuration of a Server,” on page 1185](#)
- ♦ [Section 36.3.5, “A Use Case: Configuring NetWare Servers,” on page 1185](#)

36.3.1 Filtering the Traps

You can display the Traps in the table based on filter conditions.

You set up a filter by selecting criteria from four drop-down lists. You can set up simple filters that contains only one line, or complex filters consisting of multiple lines or groups. If you set up a filter using more than one line, you must also specify the logical relationship between the lines.

To set up a filter:

1 In ConsoleOne, right-click the object under a Site Server object, then click *Actions*, then click *Trap Configuration*.

2 In Trap Configuration page, click *Filters*, then click the *Filter* menu.

3 In the first drop-down list, select the column by which you want to filter the Traps.

4 Select an operator from the second drop-down list.

The operator defines the constraint value set for the column. You can specify equal to, not equal to, less than, greater than, greater than or equal to, less than or equal to, contains, or start with.

5 Select a value from the third drop-down list.

The list of available values depends on the value you have selected in first drop-down list. For example, if you have selected Severity in the first drop-down list, the values in the third drop-down list are Critical, Major, Minor, Informational, and Unknown. If you have selected Enable in the first drop-down list, the available values are Enabled and Disabled.

6 Select a value from the fourth drop-down list to specify how this filter statement relates to other statements you plan to define.

- ♦ If this is the only filter statement or if it is the last statement in a group, select End.
- ♦ If you want to add a line below the current filter statement, select New Row. You must define the logical relationship between the previous line and the new line. The Traps are displayed based on the logical condition you have specified. Select And to satisfy both the filter conditions. Select Or to satisfy any one of the filter conditions.
- ♦ If you want to add one or more lines that are unrelated to the preceding lines, select New Group. An additional drop-down list separates the new line from the preceding lines. Select a value from this drop-down list to indicate the relationship between the filter statements. Select And if you want both the filter statements to be satisfied. Select Or if you want only one of the filter statements in one of the groups to be satisfied. Select End from the fourth drop-down list when you add a new group.

7 Click *OK*.

The Trap configuration list displays only those entries that meet the filter criteria.

To clear the list and go back to the default view, click *Clear Filter* under *Filters*.

36.3.2 Sorting the Traps

You can modify the order in which the Traps are displayed in the Trap Configuration by sorting the Traps.

Double-click the column header for the column by which you want to sort the entries to sort the entries in the view in descending order. To sort the entries by ascending order, double-click the column header again.

36.3.3 Managing Profiles

Profile is a set of predefined configuration of the Traps. You can have a profile consisting of specific set of Traps. For example, you can create a profile only with File Sys Traps.

The Trap Configuration feature allows you to configure the different profiles and provides a central location for creating, managing, and controlling profiles. You can add a Trap or set of Traps to a profile.

The different tasks you can perform with Trap Configuration profile include:

- ♦ “Creating a New Profile” on page 1184
- ♦ “Editing a Profile” on page 1185
- ♦ “Deleting a Profile” on page 1185

Creating a New Profile

- 1 In ConsoleOne, right-click any object under a Site Server object, click *Actions*, then *Trap Configuration*.
- 2 In *Manage Profile* field, click the down-arrow, then click *New*.
- 3 On the New Profile page, click *Add* to open the Default Configuration View.

The Default Configuration View, where all Major and Critical alarms are enabled and interval is set to -1 for all the Traps, lists all NetWare server alarms and Novell Directory Services Traps.

- 4 Select the Traps to be included in the profile, then click *Add*.

NOTE: You can select more than one Trap by pressing Ctrl and selecting the Traps you want to include in the profile.

You can also use filters to display a specific set of Traps. For more information on filters, refer to [Section 36.3.1, “Filtering the Traps,” on page 1183](#).

- 5 In Manage Profile, click *Save* or *Save As*.
- 6 In the Profile List View, specify name of the profile in *Profile Name* text box, then click *Save*.

NOTE: If you use an existing profile name, the system asks you if you want to overwrite the existing profiles. If you click *Yes*, the existing profile is over-written by the profile you are creating.

The newly created profile is added to the *Profiles* drop-down list.

Editing a Profile

- 1 In ConsoleOne, right-click the node under a Site Server object, click *Actions*, then click *Trap Configuration*.
- 2 Select the profile you want to edit. The corresponding Traps are displayed in the Trap Configuration page.
- 3 To add more Traps to the profile list, click *Add* and add the desired Traps from Default Configuration View.

NOTE: You can also remove the Traps from the list by clicking on *Remove*. You can remove more than one Trap by pressing Ctrl and selecting the Traps you want to remove.

- 4 In *Manage Profile* field, click *Save*.
- 5 (Optional) To save the updated profile with different name, click *Save As*, specify the name in the *Profile Name* field, then click *Save*.

Deleting a Profile

- 1 In ConsoleOne, right-click Atlas, then click *Actions*, then click *Trap Configuration*.
- 2 In the *Profiles* drop-down list, select the profile you want to delete.
- 3 In *Manage Profile* field, click the down-arrow, then click *Delete*.
- 4 Click *Yes* in the Confirm Delete dialog box. The selected Profile is deleted from the drop-down list.

NOTE: You cannot delete the default profile.

36.3.4 Viewing Current Configuration of a Server

- 1 In ConsoleOne, browse through the tree to find the node for which you want to view the configuration.

You can also find the node by clicking *Find* menu in ConsoleOne.

- 2 Right click the node and select *Action*.
- 3 Select *Trap Configuration*.

The current configuration that is applied on the selected server is displayed.

36.3.5 A Use Case: Configuring NetWare Servers

Trap Configuration also allows you to configure specific set of Traps.

For example, you can use the following procedure to configure File Sys Traps:

- 1** In ConsoleOne, right-click the node under a site-server object, click *Actions*, then *Trap Configuration*.
 - 2** Click *Filters*, and then click *Filter*.
 - 3** Select *Type* in first drop-down list.
 - 4** Select *contains* in the second drop-down list.
 - 5** Specify *File Sys* in third drop-down list.
 - 6** Select *End* in fourth drop-down list, then click *OK*.
- A list of all File Sys type Traps is displayed.

Setting up Security for Management and Monitoring Services

Management and Monitoring Services should be secured to ensure protection of all components and the database.

- ♦ The software is designed to work in a secured network, behind a firewall. Make sure all the components are within a secured network or firewall.
- ♦ The database contains network topology information, that is vulnerable to hacking. Make sure the database is protected.
- ♦ MMS uses SNMP v1, which does not support any protection, because the community name is transferred in clear-text format. For SNMP communication to NetWare servers, there is an option to use SNMP over NCP, which ensures that authentication does not use any community names, but still has valid NCP connections. SNMP over NCP is not supported for Windows.
- ♦ Log files might contain information about the database user name, passwords, and community string if the debug option is set to a high level. Use high debug levels only when necessary to assist in debugging, and only for a limited time.

Documentation Updates

This section contains information on documentation content changes that have been made in the *Administration* guide for Management and Monitoring Services since the initial release of Novell® ZENworks® 7 Server Management. The information will help you to keep current on updates to the documentation.

All changes that are noted in this section were also made in the documentation. The documentation is provided on the Web in two formats: HTML and PDF. The HTML and PDF documentation are both kept up-to-date with the documentation changes listed in this section.

The documentation update information is grouped according to the date the changes were published. Within a dated section, the changes are alphabetically listed by the names of the main table of contents sections for Management and Monitoring Services.

If you need to know whether a copy of the PDF documentation you are using is the most recent, the PDF document contains the date it was published on the front title page or in the Legal Notices section immediately following the title page.

The documentation was updated on the following date:

- ♦ [Section R.1, “December 14, 2007,” on page 1189](#)
- ♦ [Section R.2, “August 16, 2006,” on page 1189](#)
- ♦ [Section R.3, “July 14, 2006 \(Support Pack 1\),” on page 1190](#)
- ♦ [Section R.4, “December 9, 2005,” on page 1190](#)

R.1 December 14, 2007

Updates were made to the following sections:

Location	Change
Section 33.1.1, “About the Topology Reports,” on page 1151	Changed the URL of Microsoft Download Center to http://www.microsoft.com/downloads/ .

R.2 August 16, 2006

Updates were made to the following sections:

Location	Change
Section 30.3.3, “Specifying Negative Filter Conditions in the Nttrap.ini File,” on page 1128	Added the following paragraph after the steps: For more information about filter conditions and examples in the <code>nttrap.ini</code> file, see TID 10098619 (http://support.novell.com/cgi-bin/search/searchtid.cgi?10098619.htm) in the Novell Support Knowledgebase.

R.3 July 14, 2006 (Support Pack 1)

Updates were made to the following sections:

Location	Change
Section 23.3.2, "VLAN Atlas," on page 920	This section is added.
Chapter 27, "Using the Probe Manageability Tool," on page 1021	This section is added.
Appendix Q, "Setting up Security for Management and Monitoring Services," on page 1187	This section is added to address security issues.

R.4 December 9, 2005

Page design is reformatted to comply with revised Novell documentation standards.
