Preface

About Retain

Retain Unified Archiving

- Archives email and text messages.
- Catalogs them for search and retrieval.

Retain is not a backup/restore system.

About This Guide

This is the installation and upgrade documentation for Retain Unified Archiving version 4.9.2.

For Documentation Feedback

Scroll to the bottom of the online page and enter a User Comment.

To Join the Retain Idea Exchange

Got an idea for a new Retain feature or enhancement? Log in to Microfocus.com and join the conversations happening inside the Retain Idea Exchange.

For Additional Documentation

See the Micro Focus Knowledge Base website.

To Contact Technical Support

Browse to the Micro Focus Support Page (https://www.microfocus.com/support-and-services/) and begin typing *Retain Unified Archiving* in the **Search for a Product** field.

For Sales

Go to the Micro Focus Contact page (https://www.microfocus.com/en-us/contact).

For Professional Services

Contact Micro Focus Professional Services by sending an email to sales@microfocus.com or calling (877) 772-4450.

1 Installing Retain 4.9.2

Retain Deployment Checklist

For a successful Retain deployment, complete the following tasks in the order listed, choosing those that apply to your deployment.

1. Get a copy of your company's retention policy and follow it as you work through the "Retain Planning and Design Best Practices" in *Retain 4.9.2: Planning*.

2. Identify Retain admin credentials you plan to use.

3. Gather and document the SMTP host connection information.

4. Install a web server. See "Installing a Web Server" on page 8

5. Gather the database connection information, DNS name or IP address, Retain database name, retain database user name and password.

6. Create a database for Retain to use. See "Creating and Maintaining an SQL Database" on page 9

7. Download and install Retain on your chosen platform:

   - **Linux:** "Installing a Retain Server on Linux" on page 19
   - **Windows:** "Installing a Retain Server on Windows" on page 21

8. If desired, set custom storage paths. See "Setting Custom Storage Path Rights on Linux" in *Retain 4.9.2: Planning*.

9. Configure the Retain server. "Running the Retain Server Configuration Wizard" on page 31.

10. Install the production Retain Worker Agents.

    - **Linux:** "Deploying Production-Use Worker Agents on Linux" on page 46
    - **Windows:** "Installing Additional Retain Workers on Windows" on page 48

11. If archiving mobile devices, install the Retain Router. "Installing a Retain Message Router on Linux" on page 47 or "Installing a Retain Message Router on Windows" on page 49

12. Access Retain's management interface. "Logging In as an Administrator" on page 35

13. Configure Reporting and Monitoring. See "Configuring the R&M Server" in *Retain 4.9.2: Configuration and Administration*.

14. Create and configure jobs for the systems you are archiving.

15. Configure the Reports you need. See "Retain's Reports" in *Retain 4.9.2: Configuration and Administration*.

16. Confirm that data is being archived. See "Using Retain's Archives" in *Retain 4.9.2: User Guide*.

17. Upload the required licenses. "Licensing" on page 38

18. Set up the Tools your deployment needs. See "Tools Overview" in *Retain 4.9.2: User Guide*.

Installing a Web Server

Retain requires a web server on each server running a Retain component (Server, Worker, etc.).

Linux Web Server

1 Install the Apache Web Server distributed with your SLES server.

2 Make sure you also select and install the following Apache components:

- *apache2-mod_jk* - Connectors between Apache and Tomcat Servlet Container
- *apache2-prefork* - Apache 2 "prefork" MPM (Multi-Processing Module)
- *apache2-worker* - Apache 2 worker MPM (Multi-Processing Module)

Windows Web Server

NOTE: Micro Focus recommends using IIS on Windows, but Apache can be used if necessary. See the Apache web site for installation instructions.

If you must use Apache instead of IIS, skip to "(Optional) Apache Install on Windows" on page 9. Otherwise, continue with this section.

1 If you are using IIS and it is not already installed, install it now along with the ISAPI Extensions and Filters.

The ISAPI Extensions and Filters allow Retain to gather and manipulate information about Internet traffic on the system.

2 If your system has IIS installed and running without the ISAPI components, do the following:

2a Open the Server Manager.

2b In Server Manager, click the **Manage** menu, then click **Add Roles and Features**.

2c In the Add Roles and Features wizard, click **Next**.

2d Select the installation type and click **Next**.

2e Select the destination server and click **Next**.

2f On the Server Roles page, expand **Web Server (IIS)**, expand **Web Server**, expand **Application Development**, and then select **ISAPI Filters** and **ISAPI Extensions**.

2g Click **Next**.

2h On the Select Features page, click **Next**.

2i On the Confirm Installation Selections page, click **Install**.

2j On the Results page, click **Close**.

(Optional) Apache Install on Windows

If you need to use Apache instead of IIS, do the following:

1. Download the 2.2.x binary for Windows from apache.org.

   IMPORTANT: Retain only supports version 2.2.*x*.

2. Install normally, accepting all of the defaults.

Creating and Maintaining an SQL Database

- ◆ "The Database Is Your Responsibility" on page 9
- ◆ "The Database's Role in Retain" on page 9
- ◆ "Never Use NFS Shares in a Database System." on page 9
- ◆ "If You Need a Secure Database Connection" on page 10
- ◆ "Basic Setup Overview" on page 10
- ◆ "Example Instructions for Your Reference" on page 10

The Database Is Your Responsibility

IMPORTANT: Your organization is entirely responsible for the Retain database.

Micro Focus strongly recommends that it be installed, configured, tuned, and maintained on one of the supported database platforms by qualified database administrators. See "SQL Database" in *Retain 4.9.2: Planning*.

Providing adequate instructions for the above tasks on the various Retain-supported database platforms is well beyond the scope of this guide.

The setup and configuration instructions in "Example Instructions for Your Reference" on page 10 are only for proof-of-concept deployment use.

The Database's Role in Retain

Retain stores header data and pointers to the Retain datastore in an SQL database.

Retain administrators are responsible to ensure that Retain databases are properly installed, configured, tuned, and maintained.

Never Use NFS Shares in a Database System.

NFS locking is insufficient for database requirements and results in corruption.

If You Need a Secure Database Connection

You can secure the connection between Retain and a remote MySQL or MariaDB database. (Securing connections to other supported database types is not currently supported.) See "Securing the Database Connection" in the *Retain 4.9.2: Planning* guide.

Basic Setup Overview

Setting up the Retain database involves the following general steps:

1. Download a supported database platform. See "SQL Database" in *Retain 4.9.2: Planning*.
2. Install it on one of the following, according to your organization's needs:
   - A dedicated database server (recommended).
   - The Retain server itself for a small, all-in-one deployment.
3. Create a database for Retain to use.
4. Create a user/role with ownership rights to the database that you just created.

IMPORTANT: Deploying Retain requires that you provide:

- The database name
- The database user's/role's name
- The user's/role's password

Example Instructions for Your Reference

The following sections contain sample instructions and tips that might be useful if you are setting up a proof-of-concept Retain deployment.

They are not adequate for deploying Retain in a production environment, which requires assistance from a qualified database administrator.

- "MySQL" on page 10
- "MS SQL Server 2016, 2017" on page 12
- "ORACLE" on page 12
- "Postgres 10.9" on page 14
- "MariaDB 10.*x*" *on page 14*
- "Further Database Tuning" on page 15

MySQL

1. Download and install the latest MySQL server and client and configure according to local system needs.
   a. Install the server: `rpm -ivh MySQL-server-version.sles11.x86_64.rpm`
   b. install the client: `rpm -ivh MySQL-client-version.sles11.x86_64.rpm`
   c. Modify /usr/my.cnf, to move the database to a data volume, by adding the line datadir=/path/to/where/you/want/the/MySQL/data
   d. Find the root password in /root/.mysql_secret

```
cat /root/.mysql_secret
```

    e. Start MySQL:

```
rcmysql start
```

    f. Change the root password:

```
/usr/bin/mysql_secure_installation
```

2. Log in to MySQL using the client:

```
mysql -u root -p
```

3. Create the database: * This is critical. Not storing the database in UTF-8 format guarantees irreparable corruption for non-US-ASCII characters. *

```
CREATE DATABASE retain DEFAULT CHARACTER SET utf8mb4 DEFAULT COLLATE
utf8mb4_unicode_ci;
```

    a. If you make a mistake, enter this command:

```
DROP DATABASE retain;
```

    b. Then repeat step 3 to create the database.

4. This step depends on which version of MySQL you are using.

- **For MySQL 5.x:** Retain needs to be configured with a user account that you grant full rights to the Retain database.

  IMPORTANT: Micro Focus strongly recommends against using the 'root' account.

  While logged in to MySQL, enter the following commands, replacing *UserName* and *Password* with the desired user name and password.

  - `GRANT ALL PRIVILEGES ON retain.* TO 'UserName'@'%' IDENTIFIED BY 'Password';`

    To restrict the connection to a specific IP address, replace the percentage sign (%) with the address.

  - `GRANT ALL PRIVILEGES ON retain.* TO 'UserName'@'localhost' IDENTIFIED BY 'Password';`

  For example, if the database user's name is `retainuser`, the password is `P@ssword1`, and you want database access restricted to `192.168.1.142`:

  - `GRANT ALL PRIVILEGES ON retain.* TO 'retainuser'@'192.168.1.142' IDENTIFIED BY 'P@ssword1';`

  - `GRANT ALL PRIVILEGES ON retain.* TO 'retainuser'@'localhost' IDENTIFIED BY 'P@ssword1';`

- **For MySQL 8.x:** You need to create the user account and then grant it full rights to the Retain database.

  While logged in to MySQL, enter the following commands, replacing *UserName* and *Password* with the desired user name and password.

  - `CREATE USER ' UserName' IDENTIFIED WITH mysql_native_password BY ' Password';`

  - `CREATE USER ' UserName'@'localhost' IDENTIFIED WITH mysql_native_password BY ' Password';`

  - `GRANT ALL PRIVILEGES ON retain.* TO ' UserName'@'localhost';`

  - `GRANT ALL PRIVILEGES ON retain.* TO ' UserName'@'%';`

If you run the mysql-database on the same server as the Retain-Server you can add the following option to your `my.cnf-configuration`:

```
[mysqld]

default-authentication-plugin=mysql_native_password
```

MS SQL Server 2016, 2017

1. Install as a default instance, with *Latin1_ General_CI_AS* as the encoding standard.
2. Enable **SQL Server Authentication** in addition to **Windows Authentication**.
3. Once installed, verify the server is listening on port 1433. At the command prompt, run:

   `telnet <IP address> 1433`
4. Ensure TCP/IP is enabled - Run SQL Server Configuration Manager
5. Expand **SQL Server Network Configuration**
6. Protocols for MSSQLSERVER
7. Enable TCP/IP
8. Run SQL Server Management Studio, connect to the Server.
9. Under Security/Logins, right-click and select **create Login, (for example Retainuser) that uses SQL Server authentication**.
10. Assign a password.
11. Right click **Databases**, create a new database named Retain and assign Retainuser as the owner.

ORACLE

Retain supports the usage of Oracle databases on all platforms. (For more information, see "Database Platforms" in the *Retain 4.9.2: Planning* guide.)

Micro Focus strongly recommends that you employ an experienced Oracle DBA to install, maintain, and tune Oracle.

The instructions below serve as a guideline, but may result in poorly performing, insecure environments.

Oracle Installation instructions vary widely depending on the version, OS, storage configuration, clustering, and so on. There is no one-size-fits-all.

This is also true of other SQL Server products, but especially for Oracle, which is why relying on a DBA is so critical.

Using Oracle with Retain requires the following tasks:

- "Installing the Oracle Server" on page 13
- "Setting Up a TCPIP Listener" on page 13
- "Creating a Database Named Retain" on page 13
- "Creating a User Account to Access the Retain Database" on page 14
- "Tuning Oracle" on page 14

Installing the Oracle Server

Install your Oracle Server normally, according to your standards and practices. One option is to use the Universal Installer, specifying a custom installation, choose the type of Oracle Server to install, and to Install Files Only

Setting Up a TCPIP Listener

Next use the Net Configuration Assistant (or manually edit the Oracle Listener configuration) to create a TCP based listener on port 1521. This allows TCPIP clients to connect to Oracle and is required for Retain.

Creating a Database Named Retain

Next, either use the Database Configuration Assistant or manually create the database with your favorite tool. Regardless, you want to create a database and `sid`, named Retain, and create your SYSTEM account

An example of a create statement (do not use as is):

```
connect "SYS"/"&&sysPassword" as SYSDBA
set echo on
spool C:\oracle\product\10.2.0\admin\Retain\scripts\CreateDB.log
startup nomount pfile="C:\oracle\product\10.2.0\admin\Retain\scripts\init.ora";
CREATE DATABASE "Retain"
MAXINSTANCES 8
MAXLOGHISTORY 1
MAXLOGFILES 16
MAXLOGMEMBERS 3
MAXDATAFILES 100
DATAFILE 'C:\oracle\product\10.2.0\oradata\Retain\system01.dbf' SIZE 300M REUSE
AUTOEXTEND ON NEXT 10240K MAXSIZE UNLIMITED
EXTENT MANAGEMENT LOCAL
SYSAUX DATAFILE 'C:\oracle\product\10.2.0\oradata\Retain\sysaux01.dbf' SIZE 120M
REUSE AUTOEXTEND ON NEXT 10240K MAXSIZE UNLIMITED
SMALLFILE DEFAULT TEMPORARY TABLESPACE TEMP TEMPFILE
'C:\oracle\product\10.2.0\oradata\Retain\temp01.dbf' SIZE 20M REUSE AUTOEXTEND ON
NEXT 640K MAXSIZE UNLIMITED
SMALLFILE UNDO TABLESPACE "UNDOTBS1" DATAFILE
'C:\oracle\product\10.2.0\oradata\Retain\undotbs01.dbf' SIZE 200M REUSE AUTOEXTEND
ON NEXT 5120K MAXSIZE UNLIMITED
CHARACTER SET AL32UTF8
NATIONAL CHARACTER SET AL16UTF16
LOGFILE GROUP 1 ('C:\oracle\product\10.2.0\oradata\Retain\redo01.log') SIZE
51200K,
GROUP 2 ('C:\oracle\product\10.2.0\oradata\Retain\redo02.log') SIZE 51200K,
GROUP 3 ('C:\oracle\product\10.2.0\oradata\Retain\redo03.log') SIZE 51200K
USER SYS IDENTIFIED BY "&&sysPassword" USER SYSTEM IDENTIFIED BY
"&&systemPassword";
spool off
```

The most critical items to note are the CHARACTER SET (AL32UTF8 aka UTF8), and the NATIONAL CHARACTER SET (AL16UTF16). If using a GUI based installed, make sure that you set these because they are easily missed. (They are located on the Encoding tab of the 10th step or so in the wizard).

Creating a User Account to Access the Retain Database

Finally, using the SYSTEM account, connect to the database, create a user, and grant full system privileges to the account. An example is shown below:

CREATE USER user-name IDENTIFIED BY password;

grant dba to user-name;

Restart everything, and verify you can telnet on the TCP LISTENER's PORT (1521 if as above).

If a restricted user is desired, Retain requires a user with the following role:

- RESOURCE CONNECT

And the following database privileges to the Retain database:

- CREATE PROCEDURE
- CREATE SESSION
- CREATE SYNONYM
- CREATE TABLE
- CREATE TYPE
- CREATE VIEW

Tuning Oracle

Tuning Oracle is well beyond the scope of this manual and requires Oracle's online guides, as well as an experienced DBA or extensive training.

Postgres 10.9

When creating a PostgreSQL database for use by Retain, specify **UTF8 encoding**.

If the Retain Server is on a different machine, you must configure PostgreSQL to accept connections from that machine's IP address.

1. Connect to PostgreSQL using its psql utility.
2. Create a new database and user for use by Retain. The example below creates a user named "retainuser":

CREATE DATABASE retain WITH OWNER = retainuser ENCODING = 'UTF8' TABLESPACE = pg_default CONNECTION LIMIT = -1;

MariaDB 10.*x*

You install MariaDB using YaST.

Log into MariaDB, and set up the Retain database and user.

1. Create the database: * This is critical. Not storing the database in UTF-8 format guarantees irreparable corruption for non-US-ASCII characters. *

    CREATE DATABASE retain DEFAULT CHARACTER SET utf8mb4 DEFAULT COLLATE utf8mb4_unicode_ci;

    a. If you make a mistake, enter this command:

DROP DATABASE retain;

b. The repeat this step to create the database.

2. Retain needs a user account created that has full rights to the Retain database.

IMPORTANT: Micro Focus strongly recommends against using the 'root' account.

While logged in to MariaDB, enter the following commands, replacing *UserName* and *Password* with the desired user name and password

Both commands are needed. The '%' is a wildcard. If you want to restrict the connection to a specific IP address, specify the address instead of the '%' sign.):

```
GRANT ALL PRIVILEGES ON retain.* TO 'UserName'@'%' IDENTIFIED BY 'Password';
```

```
GRANT ALL PRIVILEGES ON retain.* TO 'UserName'@'localhost' IDENTIFIED BY
'Password';
```

For example, if the database user's name is "retainuser" and the password is "P@ssword1":

```
GRANT ALL PRIVILEGES ON retain.* TO 'retainuser'@'%' IDENTIFIED BY 'P@ssword1';
```

```
GRANT ALL PRIVILEGES ON retain.* TO 'retainuser'@'localhost' IDENTIFIED BY
'P@ssword1';
```

Further Database Tuning

You are responsible to tune the SQL Database Server. Tuning database servers for performance often requires an experienced DBA.

You are also responsible for backing up, managing storage, and ensure that the database is fault tolerant.

MySQL

You should periodically optimize the Retain tables in order to achieve optimum query and update performance. This can have a big impact on the performance of archive jobs, deletion jobs, etc. It is also a good idea to optimize the memory settings for MySQL.

Backing Up the Database

Be sure to back up (dump) the database (https://support.microfocus.com/kb/doc.php?id=7019083) before performing any maintenance. If on a VM, you can alternatively back up the VM or take a snapshot.

Optimizing Tables

WARNING: This should be done during a maintenance window because it locks the tables and can take hours to complete (or days for larger databases).

The time required is a function of the number of records in the tables, the power of the underlying hardware, and the RAM available. The more innodb_buffer_pool_size you can give to MySQL, the more tablespace it can load into RAM as explained here (https://dev.mysql.com/doc/refman/5.5/en/glossary.html#glos_buffer_pool).

Like hard disks, database tables' indexes can become fragmented resulting in poor performance. Optimizing tables can dramatically improve archive job and deletion job performance.

At the command prompt, type: `mysqlcheck -o -u root -p retain`

- ◆ "-o" instructs it to optimize all tables in the database.
- ◆ "-u root" specifies the user "root".
- ◆ "-p" causes it to prompt for the retain database password.
- ◆ "retain" instructs it to run against the "retain" database (or whatever you named it during installation - "retain" is the default).

The command above optimizes all Retain tables at once. However, many are static and would not necessarily be subject to fragmentation issues.

Paste the following query into the MySQL prompt after logging into MySQL. This optimizes the tables one at a time.

These are the Retain 3.x tables you might consider optimizing:

```
OPTIMIZE TABLE retain.Audit;
OPTIMIZE TABLE retain.s_AddressBookCache;
OPTIMIZE TABLE retain.t_abook;
OPTIMIZE TABLE retain.t_document;
OPTIMIZE TABLE retain.t_dsref;
OPTIMIZE TABLE retain.t_message;
OPTIMIZE TABLE retain.t_message_attachments;
OPTIMIZE TABLE retain.t_message_properties;
OPTIMIZE TABLE retain.t_message_recipients;
OPTIMIZE TABLE retain.t_recipient;
```

These are the Retain 2.x tables you might consider optimizing if you are planning on migrating to Retain 3.x in the next few days or weeks:

```
OPTIMIZE TABLE retain.Audit;
OPTIMIZE TABLE retain.Document;
OPTIMIZE TABLE retain.Email;
OPTIMIZE TABLE retain.t_Node;
OPTIMIZE TABLE retain.t_attachment;
OPTIMIZE TABLE retain.t_msg_properties;
OPTIMIZE TABLE retain.t_recp_properties;
OPTIMIZE TABLE retain.t_recipients;
```

You can check on the progress of the queries by opening a separate terminal window and launching the following command:

watch -n 1 "mysqladmin -u root -p[password] processlist"

(note: no space between "-p" and your mysql root user password!)

NOTE: Retain uses the innoDB engine in MySQL, which does not support the optimize option; however, running this option automatically performs a re-create action on the tables, which eliminates the fragmentation. There might be better ways to accomplish this, so this information is supplied to point you in the right direction.

For more detailed information and other mysqlcheck options, you may want to research this on the Internet. For your convenience, here are a couple of helpful articles:

4.5.3. mysqlcheck - A Table Maintenance Program (http://dev.mysql.com/doc/refman/5.0/en/mysqlcheck.html#option_mysqlcheck_analyze)

MySQL Back to Basics: Analyze, Check, Optimize, and Repair (http://www.pythian.com/blog/mysql-back-to-basics-analyze-check-optimize-and-repair/) (written in 2008)

[MySQL Reference Manual on getting a dump of a corrupted database (http://dev.mysql.com/doc/refman/5.5/en/forcing-innodb-recovery.html)](http://dev.mysql.com/doc/refman/5.5/en/forcing-innodb-recovery.html) This is sometimes the only option for recovering data from a corrupted INNODB database.

Memory Optimization

Memory for your innoDB can be configured in `/etc/my.cnf` (Linux) or on Windows, in the `[drive]:\Program Files\MySQL\MySQL Server 5.x/my.ini` file (where "x" is the MySQL version).

You'll find the following section in your `my.cnf` and there are identical lines in the `my.ini` on Windows although they may not be in this same order. The settings you may want to consider modifying are in red. This is followed by indented explanations in blue and are additional comments made for this article - those additional comments are not found in the `my.cnf` or `my.ini`.

Be sure to stop tomcat "Starting and Stopping the Retain Server" on page 50 before working with MySQL.

Uncomment the following if you are using InnoDB tables. If it does not exist, create it.
innodb_file_per_table

The "innodb_file_per_table" is not included in the default my.cnf or my.ini and has to be typed in manually. It causes MySQL to create an .idx file for every table in the database. The benefits of this is up for debate. Some swear by it because they feel it eliminates contention for a single file containing all the tables (ibdata1); however, others have written that it is fast at first and then bogs down. We have found that, for Retain databases, it seems to positively impact performance. Do your own research and determine what is best for your system.

```
#innodb_data_home_dir = /var/lib/mysql
#innodb_data_file_path = ibdata1:10M:autoextend
#innodb_log_group_home_dir = /var/lib/mysql
# You can set .._buffer_pool_size up to 50 - 80 %
# of RAM but beware of setting memory usage too high
innodb_buffer_pool_size = 4G
```

This allocates [buffer memory for MySQL (https://dev.mysql.com/doc/refman/5.5/en/glossary.html#glos_buffer_pool)](https://dev.mysql.com/doc/refman/5.5/en/glossary.html#glos_buffer_pool) into which it can load table and index data. Obviously, accessing RAM is faster than disk, so the more memory you can give for the buffer pool, the more MySQL can load into the buffer. MySQL uses memory for other things, so if you have 6G to play with, you probably do not want the buffer pool to be larger than 4G. You'll have to experiment on your own system.

A helpful tool that is free is called mysqltuner.pl. It is a perl script that runs against your database to help you tune it's memory, security, etc. To get it, create a directory on your Linux server and change to that directory. Then type: wget mysqltuner.pl. Once it is down donwloading (takes 1 second), type: chmod +x *.pl so that it can be executed; then, execute it by typing: ./mysqltuner.pl.

innodb_additional_mem_pool_size = 204M

From what we've seen, this should be set to 5% of the buffer pool size. But, again, do your research.

```
# Set .._log_file_size to 25 % of buffer pool size
innodb_log_file_size = 1024M
```

This affects the ib_logfile0 and ib_logfile1 files in your MySQL data directory. These files hold statements/transactions. The maximum size these can be set to (regardless of your buffer pool size) is 1024M (or 1G, totaling 2 GB for all log files together) for MySQL 5.5 and 255 G (total for all log files together can be up to 512 GB) for 5.6. For more information check out the MySQL website [here (http://dev.mysql.com/doc/refman/5.6/en/innodb-parameters.html#sysvar_innodb_log_file_size)](http://dev.mysql.com/doc/refman/5.6/en/innodb-parameters.html#sysvar_innodb_log_file_size). There is also some discussion on what values you should set the log files to (see https://www.percona.com/

blog/2008/11/21/how-to-calculate-a-good-innodb-log-file-size/ (https://www.percona.com/blog/2008/11/21/how-to-calculate-a-good-innodb-log-file-size/). The maximum size these can be set to is 1024M.

IMPORTANT: If you change this setting, it would be a good idea to flush the existing logs (ib_logfile0 and ib_logfile1). To do this, take the following steps:

a) Log into MySQL: mysql -u root -p

b) From the MySQL prompt, type: SET GLOBAL innodb_fast_shutdown=0;

Then type "quit" to log out of MySQL.

c) Shut down MySQL: rcmysql stop

d) Rename the ib_logfile0 and ib_logfile1 files.

g) Start up MySQL: rcmysql start

h) If MySQL starts up successfully, you can delete the ib_logfile* files.

If you do not delete or move the exisiting ib_logfile0 and ib_logfile1 files from the MySQL data directory when changing the logfile size, MySQL does not load.

innodb_log_buffer_size = 8M

The log buffer allows transactions to run without having to write the log to disk before the transactions commit. If the transactions are large, then making the log buffer larger saves disk I/O. There is a status called "innodb_log_waits" in MySQL. This shows the number of times a wait was required for it to be flushed before continuing. If you have any waits, then the buffer size is too small. Here is the query you can run on that status: SHOW GLOBAL STATUS LIKE 'innodb_log_waits';

```
mysql> show global status like 'innodb_log_waits';
+------------------+-------+
| Variable_name    | Value |
+------------------+-------+
| Innodb_log_waits | 0     |
+------------------+-------+
1 row in set (0.01 sec)
```

```
#innodb_flush_log_at_trx_commit = 1
#innodb_lock_wait_timeout = 50
```

To enable any one of those settings, remove the hash mark ("#") preceding it. The following is an example for a typical system that has 16G of total RAM, where 2G is allocated for the Linux OS and 8G to Tomcat. The amount allocated to Tomcat versus the database varies per customer. A system where a lot of queries/searches are made in Retain for items, or that runs multiple workers on the Retain Server itself, allocates more memory to Tomcat, like in this example; otherwise, a customer might want to favor MySQL a bit and give Tomcat a little less.

Changes to the my.cnf do not take affect until after MySQL is restarted. Again, if you changed the log file size setting, you must follow the steps listed above or MySQL fails to load.

Once MySQL loads successfully, you can start tomcat .

Installing a Retain Server on Linux

Retain Prerequisites for Linux Servers

IMPORTANT: Make sure you have planned your deployment before installing the software. For example, if the Linux server doesn't have the minimum RAM Requirements for the components you specify, the installation aborts.

Successfully installing Retain and/or its components on Linux servers, requires the following:

- **An Apache Web Server:** Installed and running on each Linux server as outlined in "Linux Web Server" on page 8.

- **Access to the appropriate JDK running on the system:** By default, the installer expects the appropriate JDK to be running on the Linux system. (For Retain 4.8.1, this is JDK 11)

  If the appropriate JDK is not found and the server is connected to the Internet, the install automatically downloads and installs the JDK.

  If the appropriate JDK is not found and an Internet connection is not available, you must type the path to the appropriate JDK installation source files on the Linux server before the installation will continue.

- **Synchronized server clock:** Before you start the Retain install, the Linux server must be synchronized with the time on your network. For example, if your organization uses NTP, configure the server with your organization's NTP settings.

Downloading and Preparing the Retain Installation Files on Linux

Do the following:

1. Using your Micro Focus Customer Center account, download the latest version of Retain to the Linux server where you are installing Retain or one of its components.

2. Extract the archive into a new folder.

   - **Graphical Interface:** Right-click the download and select **Extract Here**.

   - **Terminal Prompt:** Enter the following command

     ```
     unzip Retainversion.zip
     ```

     where *version* is the release version number in the .zip filename.

3. Make the script executable.

   - **Graphical Interface:** Right-click the download and select **Properties > Permissions tab > Allow executing file as program**.

   - **Terminal Prompt:** Change to the Retain install folder that you just extracted, then enter the following command:

     ```
     chmod +x *.sh
     ```

Installing the Retain Server

The Retain Server is the main component of a Retain deployment and is installed on only one Linux server. Other Retain components can be installed with Retain or separately (as explained in Step 5 below).

IMPORTANT: Make sure that you have planned your deployment before installing Retain software. If the Linux server doesn't have the minimum RAM for the components you select, the installation aborts.

Retain installs an embedded Tomcat. Consider removing any existing Tomcat installation prior to installing Retain components.

1 If you have not already done so, download and prepare the target server with the Retain installation files, as instructed in "Downloading and Preparing the Retain Installation Files on Linux" on page 19.

2 Acting as `root`, access the server's terminal prompt and enter the following command:

   `./RetainInstall.sh`

3 Read and accept the license agreement.

TIP: To go immediately to the acceptance prompt, type `q`.

---

4 Read the software requirements and press Enter.

5 The install prompts for which of the following Retain components you want to install on the server:

Component	Placement Detail
Retain Server	Install one instance of this on the main server in your deployment
Stubbing Server	This only applies to GroupWise. See "Stubbing Server Overview" in *Retain 4.9.2: Configuration and Administration*.
Reporting and Monitoring Server	Generally, you should install this on the Retain server.
Retain Worker	Generally, you should install a Worker on the Retain server. for troubleshooting purposes. Instructions for installing production-use Workers follow this section in "Deploying Production-Use Worker Agents on Linux" on page 46.
Retain Message Router	Install this in the DMZ. For instructions, see "Installing a Retain Message Router on Linux" on page 47.

   Type `y` to install a component; `n` to not install it.

6 The install checks the server for the supported version of Java (currently JDK 11).

   If the required version is not found on the server, the installation downloads the correct version, and then upgrades or installs Java as needed.

   If the download connection fails, the installer asks whether you want to retry, abort the installation, or specify a local path to the Java installation package.

7 The install restarts Tomcat and alters the runlevel so that Retain starts automatically when the system does.

8 When the installation completes, it displays the URL for accessing the Retain Server's web console in a browser and returns to the terminal prompt.

9 Open a terminal prompt and verify that the Retain Server installed by checking that both Apache 2 and Retain Tomcat are running by entering the following commands:

```
service apache2 status
service retain-tomcat status
```

10 Continue with .

Installing a Retain Server on Windows

Downloading and Preparing the Retain Windows Installation Source Files

Do the following:

1 Using your Micro Focus Customer Center account, download the latest version of Retain to the Linux server where you are installing Retain or one of its components.

2 Using Windows Explorer, extract the archive into a new folder.

Prerequisites

Before running the Retain installer, you must first ensure that the following are installed and working:

- **A Web Server:** Installed and running on each Windows server as outlined in "Windows Web Server" on page 8.

  NOTE: IIS has a size limit restriction which limits uploads of message and attachment archiving to 30MB, by default.

- **PowerShell 3.0 or higher:** If PowerShell's execution policy is set too restrictively, the install fails.

  See Set-ExecutionPolicy (https://docs.microsoft.com/en-us/powershell/module/Microsoft.PowerShell.Security/Set-ExecutionPolicy?view=powershell-5.1).

- **Access to the appropriate JDK running on the system:** For Retain 4.8.1, this is JDK 11.

  If the appropriate JDK is not found and the server is connected to the Internet, the install automatically downloads and installs the JDK.

  If the appropriate JDK is not found and an Internet connection is not available, you must browse to the appropriate JDK installation source files on the Windows server before the installation will continue.

- **Synchronized server clock:** Before you start the Retain install, the Windows server must be synchronized with the time on your network.

Retain Install

1 Prepare the Retain installation software on the server as instructed in "Downloading and Preparing the Retain Windows Installation Source Files" on page 21.

2 Run "RetainInstall.exe". NOTE: If it already exists, the installer automatically shuts down Tomcat.

3 The Retain Setup Wizard welcomes you to the installer.
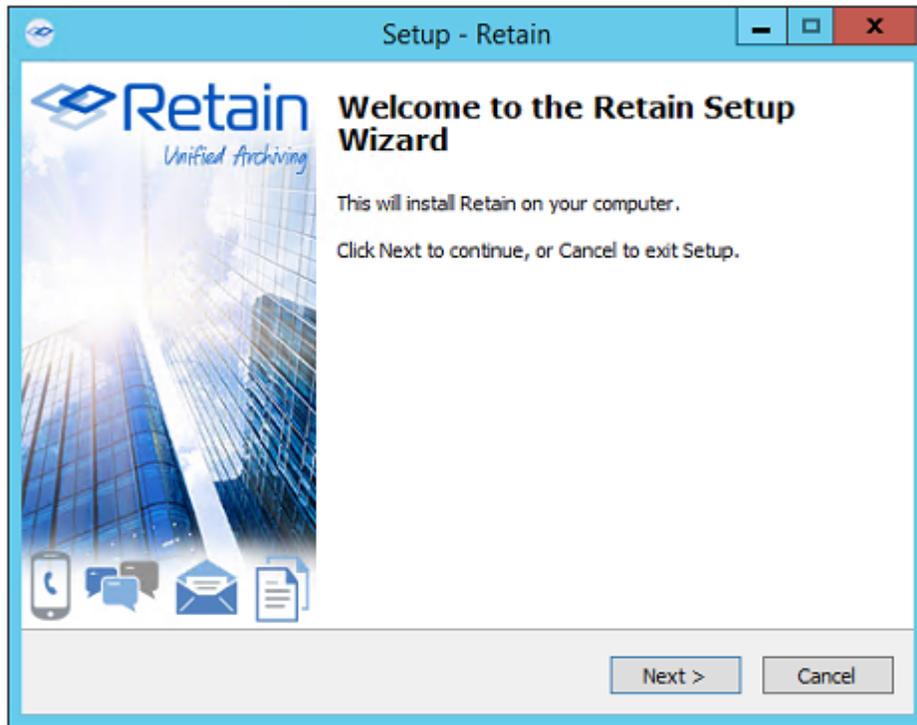

4 The Wizard reminds you of the Software Requirements. Click 'Next' to continue.
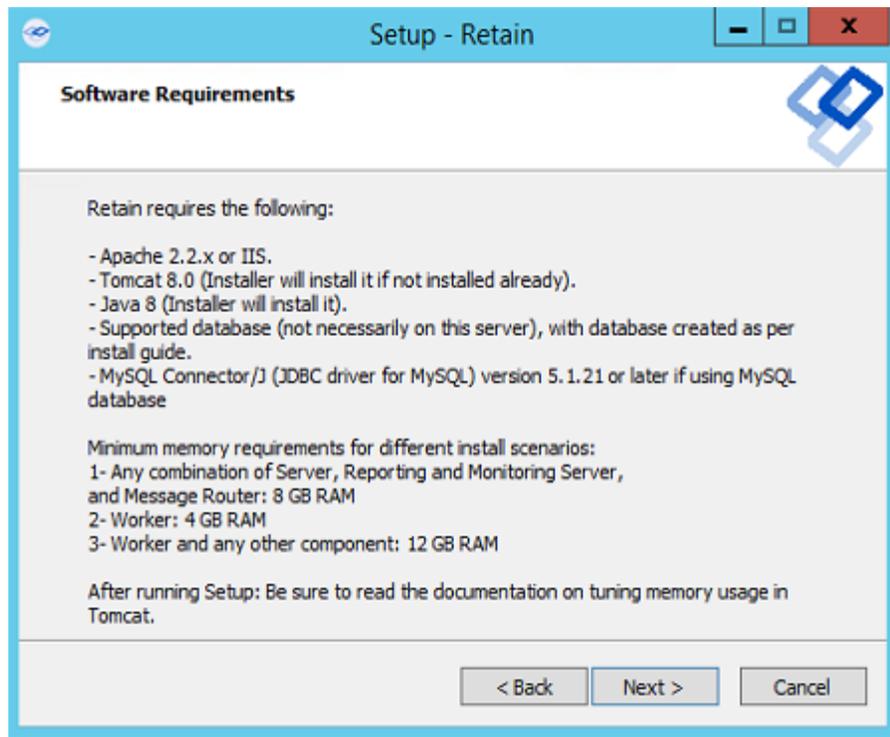

5 Agree to the license agreement.
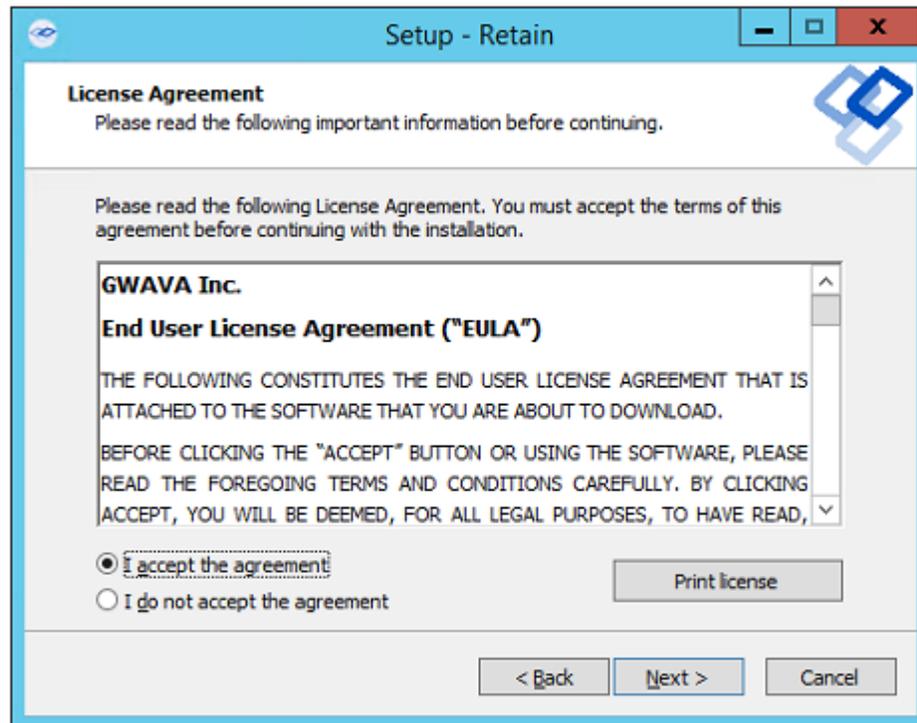

6 Select the install location.
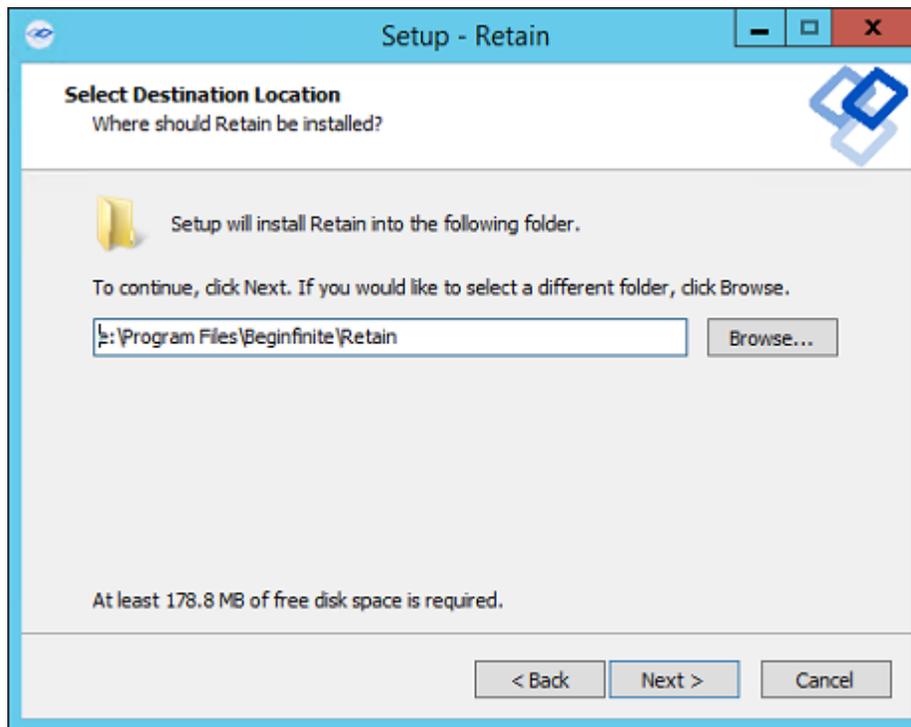

7 Select the program features to install. (Retain Server, Stubbing Server, Retain Worker, Reporting and Monitoring Server, and the Message Router.)
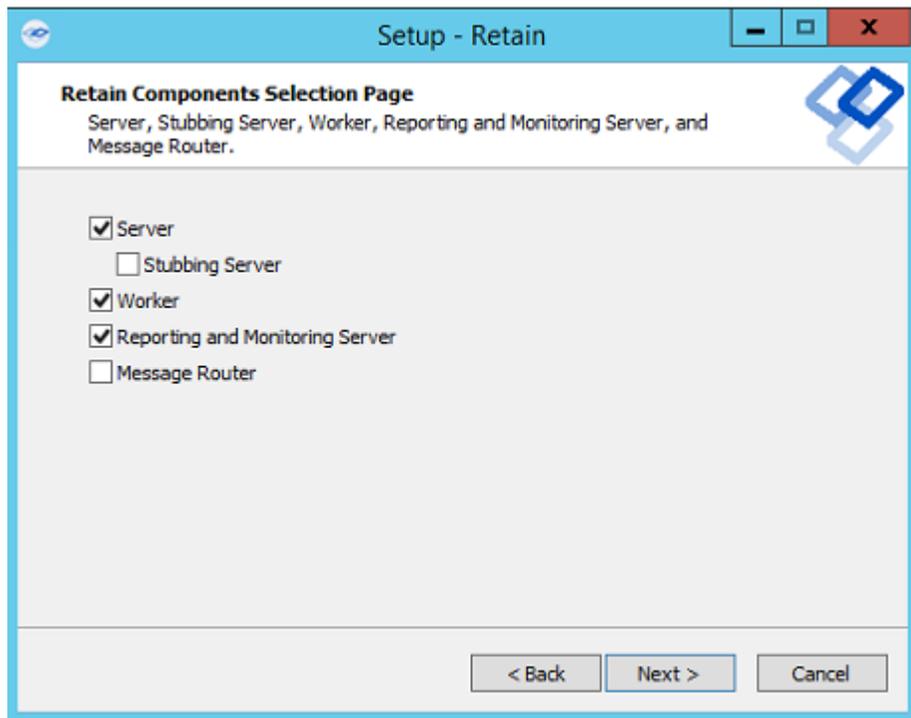

9a. If you are upgrading, previously installed components are preselected and you can select additional modules to install.
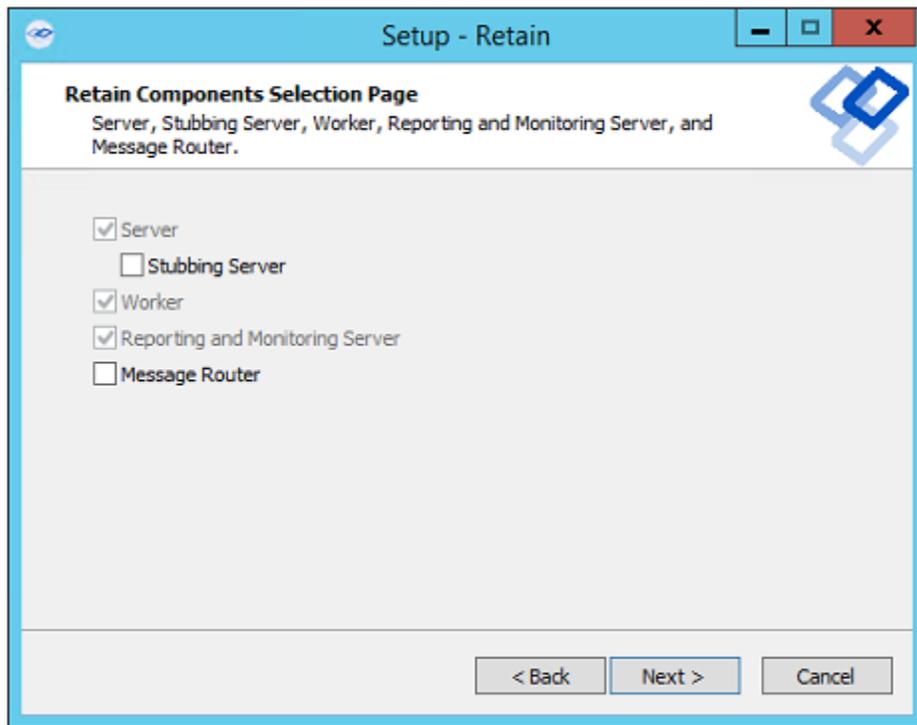

8 Pre-requirements status is displayed. Installer attempts to detect previous Tomcat installations.

If none are found, it asks whether Tomcat has been installed. Indicate 'yes' or 'no'.

If upgrading, Tomcat 7.0 is upgraded to Tomcat 8.0.

Please note that the environment variable 'RETAIN_CATALINA_HOME' is set after Tomcat installation.

Click 'Next' to continue.
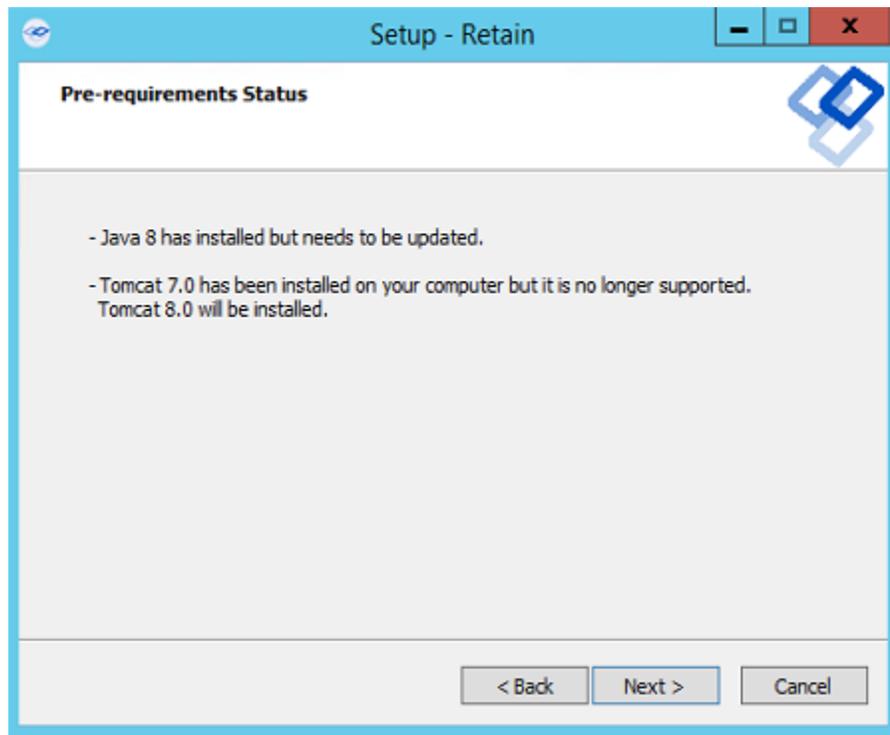

Java and Tomcat are installed or upgraded. (Note: If there are issues with Apache and Tomcat starting correctly, set the Java initial memory pool and the maximum memory pool to the same value, appropriate to the system and expected load.) Tomcat is run as a System Service and shows up in the system services list as "Retain Tomcat 8". (Start | Run | services.msc)

10a. If an Internet connection cannot be made, the installer asks whether to retry, to abort, or use a local path to the Java installation package. You can download the correct version of the Java installer for Windows here.

Setup - Retain

Java Download Failed

Could not successfully download Java install zip file. Either this server does not have access to the Internet, or a firewall, proxy server, or similar device is blocking downloads from download.gwava.com.

Please select one of the following:

○ Retry Java download.

○ Abort installation.

◉ Browse for Java install zip file previously downloaded from
http://download.gwava.com/download.php?product=jvm8&version=win64latest

[< Back] [Next >] [Cancel]

9 Select either Apache or IIS. (If apache, provide the installation directory.)

Setup - Retain

Choose a Web Server

○ Apache 2.2.x
◉ IIS

[< Back] [Next >] [Cancel]
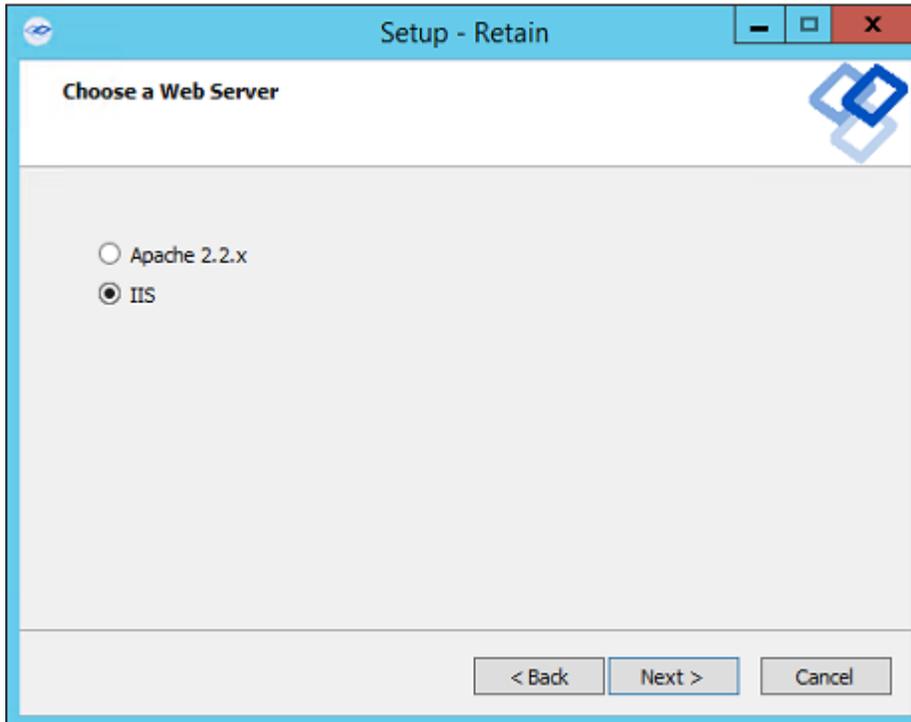

10 If a previous version of Retain is detected, upgrade options are displayed; Overwrite or Upgrade. Generally, you should choose Upgrade. Click Next.
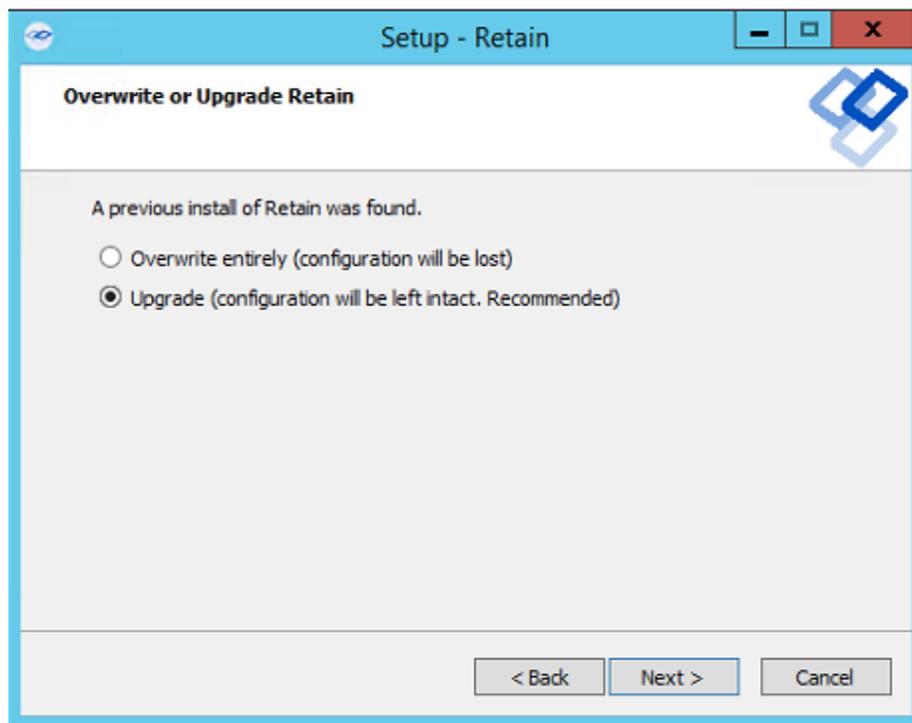

11 Confirm settings and select 'Install'.
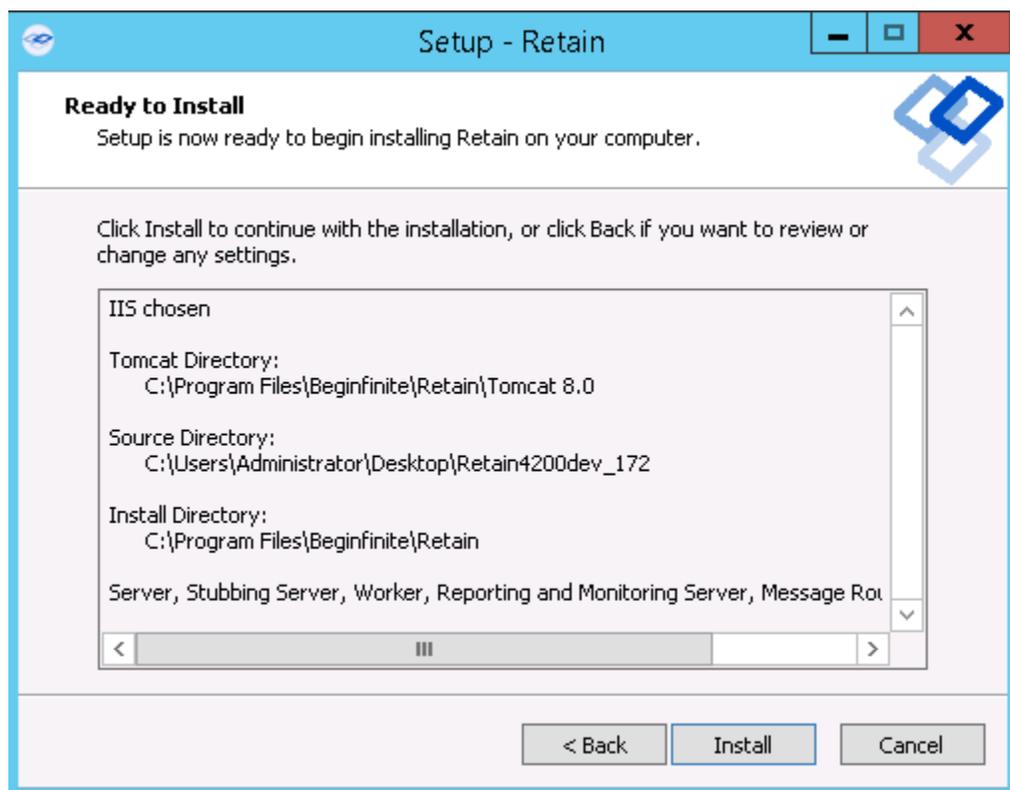

12 The product installs.
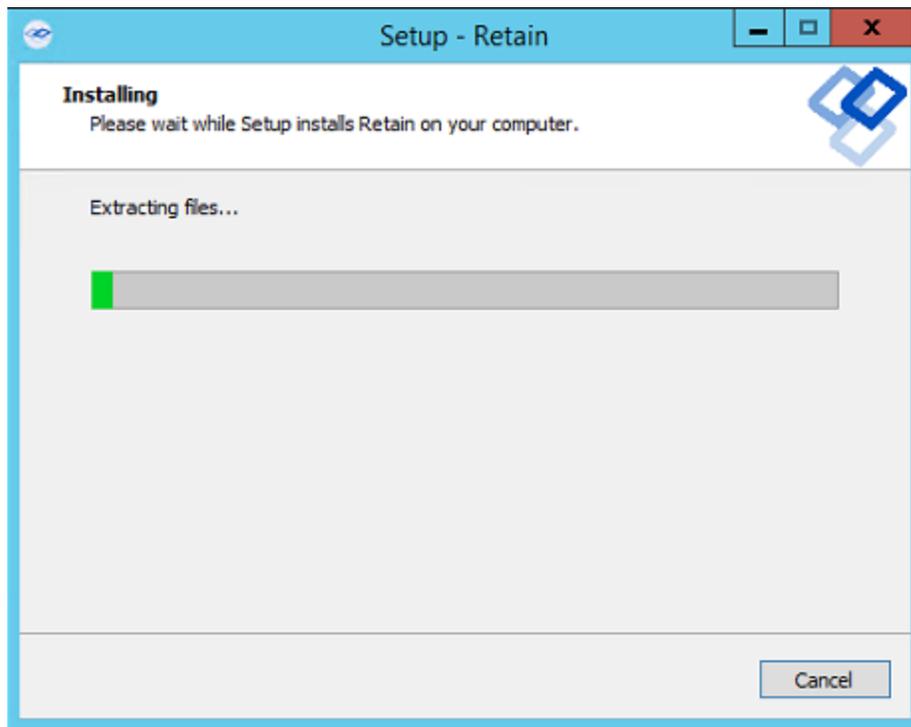

13 If Microsoft C++ 2005 Runtime distribution is not installed, the appropriate version is automatically installed.
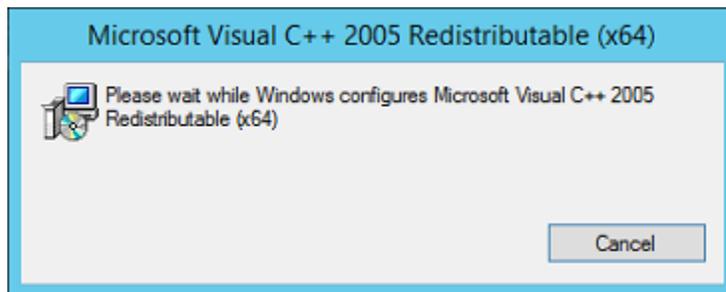

14 The Setup Wizard thanks you for installing Retain.
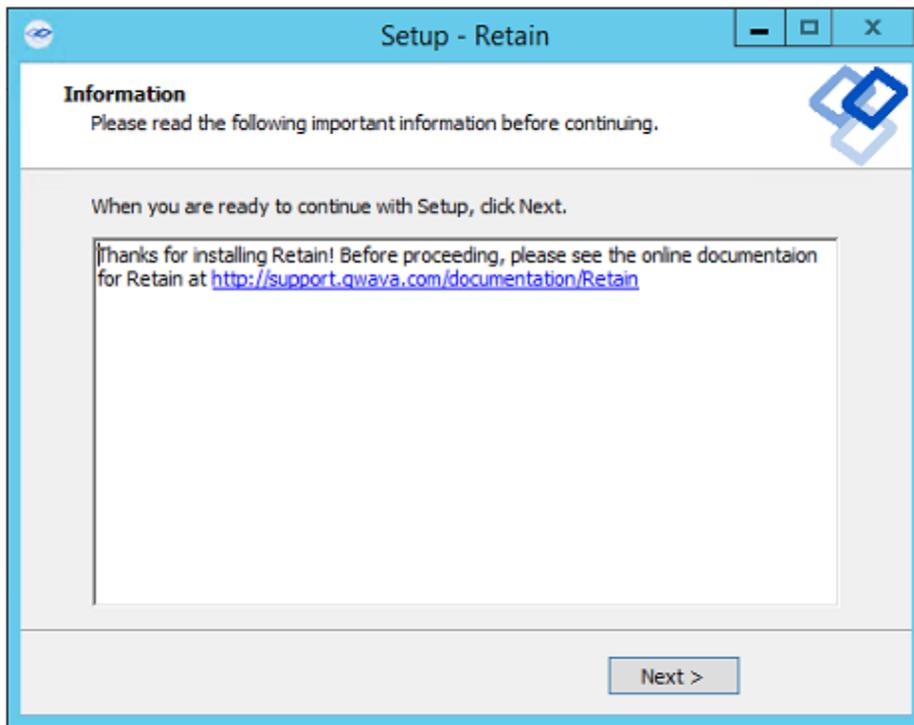

15 The Setup Wizard shows you the URL to the Retain admin console.
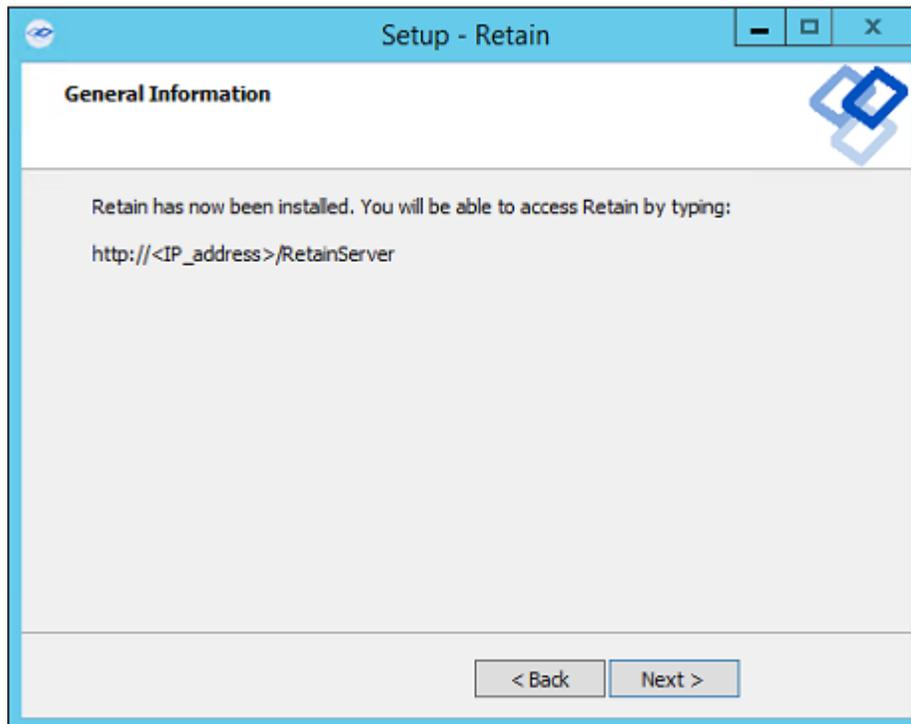

16 The Retain installation process is complete. Click Finish.
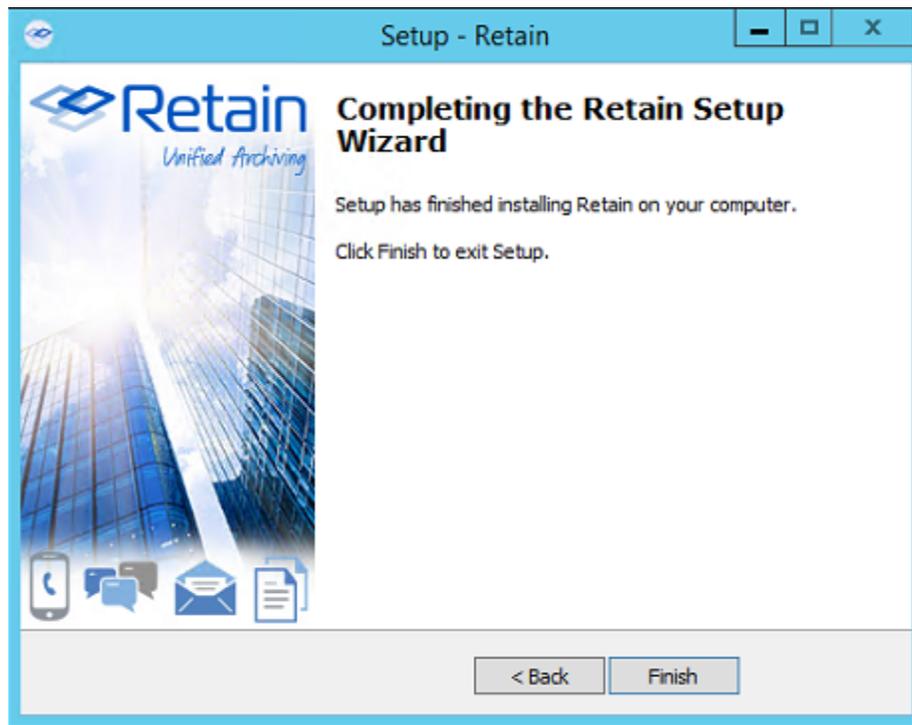

17 Continue with

Running the Retain Server Configuration Wizard

After installing the Retain Server, you must run the initial configuration wizard to prepare the server for working with all the components that will constitute your Retain deployment.

Do the following:

1 On an administrative workstation, open a supported administrative web browser.

2 Go to `http://RetainServer-IP-or-DNS/RetainServer`.

3 Run the wizard to configure the Retain Server as outlined in the following table.

Table 1-1 *Running the Retain Server Configuration Wizard*

Panel or Prompt	Action	Information
Welcome > File Path	1. Set the paths for Retain as planned in "Storage Planning" in *Retain 4.9.2: Planning*. By default, all data is stored as follows: ◆ **Linux:** `/var/opt/beginfinite/retain`. ◆ **Windows:** `C:\Program Files\Beginfinite\Retain`. Retain derives all file paths from this base path. 2. If you need to alter the base path, select **Custom** in the drop-down list and specify an alternate path. **IMPORTANT:** As outlined in "Setting Custom Storage Path Rights on Linux" in *Retain 4.9.2: Planning*, specifying an alternate storage path on a Linux system requires that you grant sufficient rights to Retain before running this wizard. 3. To customize the path for each item (attachments, XML mappings, etc.), click **Advanced Settings** and disable the **Derive all file locations from above specified path?** option. 4. When the path settings are complete, click **Continue**.	Storing data on separate volumes can yield significant performance increases. Therefore, Retain lets you specify where you want to store archived data, indexes, and so on.

Panel or Prompt	Action	Information
Message Store Database	1. Enter the database connection information for the database you created in "Creating and Maintaining an SQL Database" on page 9. 2. If your database type is MySQL or MariaDB and you want to secure its connection to Retain, click the **Enable SSL** option and proceed to the next step. Otherwise, click **Continue** and proceed to "Configuration Database" on page 34. 3. Under **SSL Configuration > KeyStore** click **Add New KeyStore Entry**. The KeyStore contains certificates and keys for client services on this Retain server. In this case, this is the Retain database client on this Retain server. 4. Type and confirm a password for the KeyStore. This establishes the password for the KeyStore on this Retain server. 5. The **KeyStore Alias** field specifies an identifying name for this server's database clients credentials that are stored in the KeyStore. The name identifies the credentials in the "Digital Certificates Tab" in the browser-based management utility. Accept the default name or modify it if desired. 6. Browse to and select the Database client server's Private Key and Certificate `.pem` files that you identified in "Securing the Database Connection" in the *Retain 4.9.2: Planning* guide. 7. The TrustStore contains the certificate and keys for database server. Under **TrustStore**, type and confirm a TrustStore password, accept or modify the TrustStore Alias, and browse to and select the database server's certificate **.pem** file. 8. Clck **Continue**.	This is the database that stores meta data for messages and other data archived in the datastore.

Panel or Prompt	Action	Information
Configuration Database	1. Enter the database connection information for the database you created in "Creating and Maintaining an SQL Database" on page 9. 2. If you are securing the connection with the Retain server, complete the KeyStore and TrustStore steps as needed, referring to the instructions for the Message Store Database as needed. 3. Click **Continue** and continue with "Administrator Account" on page 34	This is usually the same as the Message Store Database, so all connection information is carried forward to this dialog except the password. Retain lets you create and specify a separate database if desired.
Administrator Account	1. Specify and confirm a password for the main administrator account. 2. Click **Continue**.	This account ◆ Has all admin rights. ◆ Never expires. ◆ Can authenticate when the system is offline. **NOTE:** Retain lets you create as many user accounts with administrative roles as you need. If this account is deleted, you will need to contact Micro Focus support.
SMTP Notifications	1. Enter the following information: ◆ **SMTP Server:** The DNS hostname (preferred) or IP address of the SMTP server that Retain should use for emailing notifications. ◆ **From address:** The From address shown on the messages that Retain sends. ◆ **To address:** The address to which Retain sends notifications through the SMTP server. ◆ **Username:** The username for authenticating with the SMTP server. ◆ **Password:** The password for the username. ◆ Click **Continue**.	Retain uses an SMTP relay host for sending notifications. The wizard attempts to send a test message. You shouldn't proceed with setting up Retain until the SMTP test message is successfully delivered. If you see an error, check firewall settings, including local application firewalls running on affected desktops and/or servers. If no SMTP is present, you can skip this step by typing `skip` in the SMTP Mail Server field. Obviously, this disables Retain's notification services and is therefore not recommended for production deployments.
Indexing Engine	1. Enter the admin password you set earlier. 2. Click **Continue**. The system initializes and connects to the indexing engine.	

Panel or Prompt	Action	Information
Retain Server Connections	1. Set up the Retain Server connection. This sets the connection for the Router ("Retain Message Router Configuration Page" in *Retain 4.9.2: Configuration and Administration*) and REST applications, such as Retain Publisher ("Retain Publisher and Viewer" in *Retain 4.9.2: User Guide*). When possible, use the Retain Server's DNS hostname so that external devices can resolve to it.	
(Optional) Cloud Mobile Service Proxy Connection	1. (Optional) Configure the Cloud Mobile Service (CMS) Proxy Connection. If you would like to provision and register devices using CMS and have a Proxy server for your Retain server, you can specify the Proxy server information here. 2. Click **Continue > Complete**. The Retain login prompt displays.	

Retain's Browser-based Management Tool

You manage the Retain server and its associated components using browser-based administrative consoles.

- "Logging In as an Administrator" on page 35
- "Retain Server Administrative Console" on page 36
- "Always Remember to Save Changes" on page 37
- "Notifications" on page 37

Logging In as an Administrator

1 Enter the following URL in an administrative web browser.

    http://*Retain-Server-IP-or-DNS*/RetainServer

2 Sign in as admin by using the password that you specified in the configuration wizard.

   Users with administrative rights see the administrative console below. Non-administrators see only the Search interface documented in "Using Retain's Archives" in the *Retain 4.9.2: User Guide*.)

Retain Server Administrative Console

Figure 1-1 *The Retain Server's Administrative Console Landing Page*
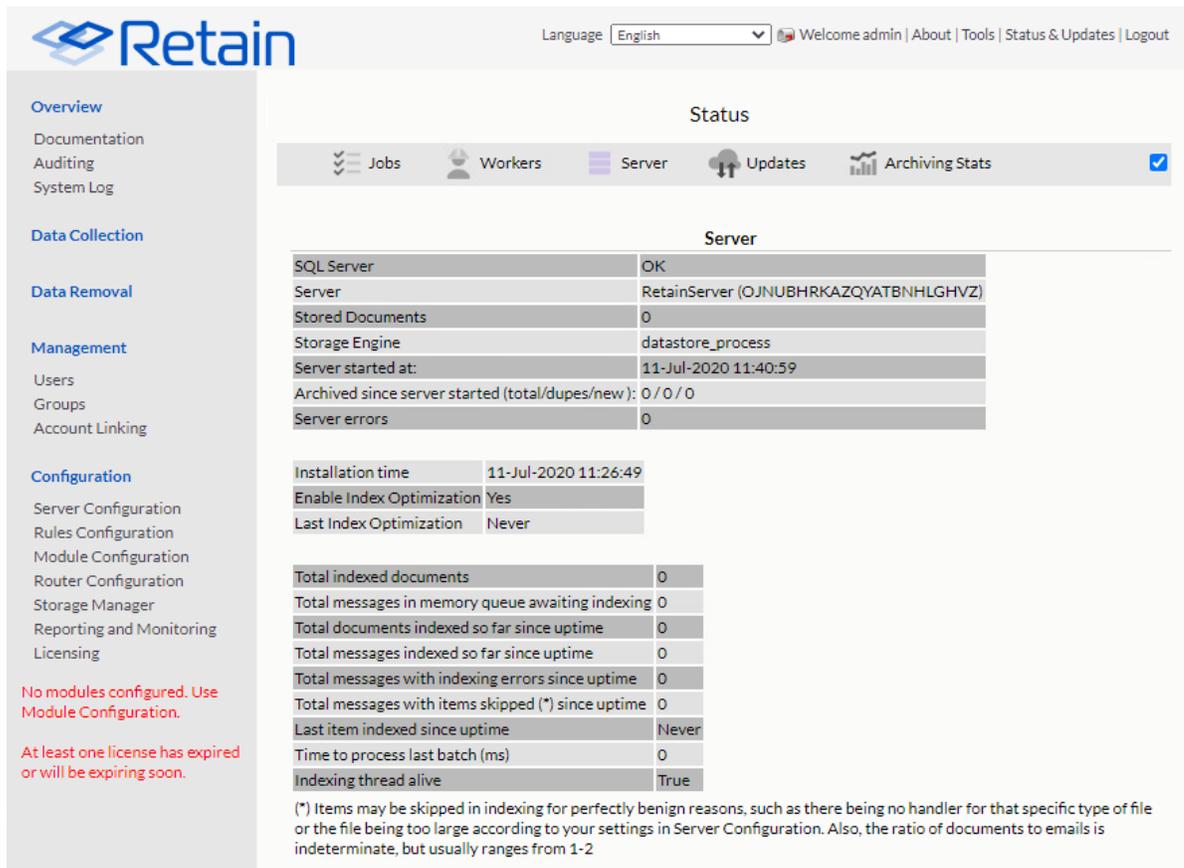

Table 1-2 *Navigating Retain's Administrative Console's Landing Page*

Field, Option, or Button	Information and/or Action
Left Navigation Panel	
	This provides access to all of the Retain server's configuration and management dialogs. Panel items grow dynamically as you add components to the Retain infrastructure,
	For example, the Overview section initially has four entries: Documentation, Search Messages, Auditing, and System Log. When you add a Reporting and Monitoring server, the entries expand to provide direct access to those services.
Status Panel	
	The status panel has five tabs: Jobs, Worker, Server, Updates, and Archive Stats.
	When you open the Retain Console, the tab requiring the most attention displays.
	For example, if a Server Error has occurred, the Server tab displays. If an update is available, the Update tab displays, and so on.
	Statistics in the tabs are for the current server session. They are cleared and start fresh each time the Retain server (Apache Tomcat) starts/restarts.

Field, Option, or Button	Information and/or Action
Jobs Tab	This shows the server's jobs and their status.
	To see only active jobs, select the **Show only active jobs** option.
Worker Tab	The workers tab displays the workers and their last active jobs, connections, and totals.
Server Tab	The Server tab shows the basic status of the Server with the messages archived and maintenance information.
Updates Tab	The updates tab indicates that the latest version is installed or that there is a later version available.
	IMPORTANT: Information displays only during initial access to the console's landing page after the server starts/restarts. Navigating to another section of the console clears tab content.
	You must restart Tomcat to display the information again.
Archive Stats Tab	This tab is deprecated and its functionality replaced by the Reporting and Monitoring server.
	Basically, it provides a small statistics summary from a basic search of the server's archive statistics.

Always Remember to Save Changes

When you see Save Changes highlighted in red at the top-right corner of the screen, be sure to click it. Otherwise, changes you have made are lost.

Notifications

Retain uses its SMTP configuration to notify when data is moved because of a system migration, or exporting, forwarding, restoring or publishing data.

To view the Notifications Center page, click the Welcome link at the top of the Admin Console page. A lifted-flag icon indicates new notifications.
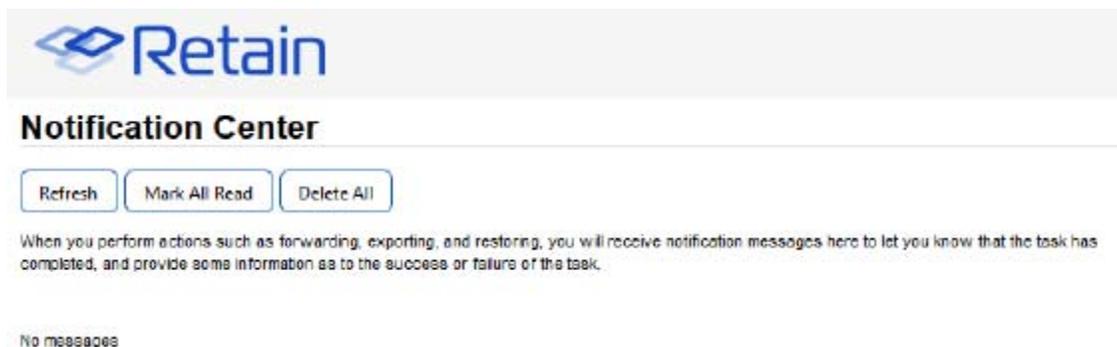

The highlighted notifications are new, unread notifications and events. Selecting the event notification provides all the pertinent information regarding the event.

If there are errors, Retain provides a truncated error log that details the error and the reason for it.

Licensing

About Retain Licenses

Retain comes with a 30-day trial license. This is a fully operational trial to see if Retain works with your system.

When your licenses expire, Retain displays only the license page so that you can upload a valid license.

There are two kinds of licenses: PEM and REST. PEM licenses are used for most functions. Some functions require using the REST API, which requires a REST license as well.

The Licensing Page

The Licensing page lets you view and manage the licenses installed in the Retain System. The status displays active users, inactive users, merged mailboxes, and individual counts for active and inactive users on each licensed module.

Path: Retain Server Manager > Configuration > Licensing

General Summary Panel

- **Date** contains today's date.
- **Product** is what version of Retain is currently installed.
- **License Count** is the number of mailboxes archived by Retain. **Active** mailboxes have had data archived in the last 90 days, **Inactive** mailboxes have had no new data archived in the last 90 days.
- **Merged Mailboxes** is the number of mailboxes merged with Mailbox Mapping Options and/or the Mailbox Merger/Splitter.

Generate Licensing Report creates a PDF file which displays the same information as seen in the **License Summary** section and lists the licenses.

Licenses Panel

The Licenses panel displays the currently installed license.

After the initial installation, Retain functions for 30 days for evaluation purposes.

When this period elapses, the following occurs:

- Users without the "Manage Servers" right are not allowed to log in at all.
- Users with the "Manage Servers" right are allowed access, but only to the Licensing Page.
- All jobs continue to be processed normally

Installing Your Retain Licenses

You should receive an email with your validation keys, including one for base server access and another for the module used for archiving from your email system. You can also find the keys in the Micro Focus Customer Center.

1. Log in to the Micro Focus Customer Center https://licenses.gwava.com/ (https://licenses.gwava.com/)
2. Select the proper Product from the drop down menu.
3. Enter the Validation Key and click Next.
4. Fill out the contact information and click Next.
5. Download the PEM file.

Submitting a PEM License

To upload a new PEM license:

1. Browse to the RetainServer console.
2. Select *Licensing* from the left navbar.
3. Scroll to the bottom of the page.
4. Click the Choose File button from the Submit License section.
5. Browse to and select the desired license file.
6. Click the Submit License button.
7. The new license is added to the system.
8. Log out and in again to the server to see the license in effect.

Installing a REST License

Some components require that you install a REST license file.

1. Go to *Server Configuration/REST API.*
2. Scroll down to Submit License, Browse to the ZIP file and press Submit License.
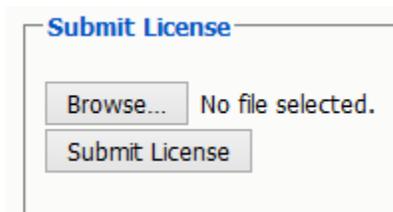

3. The license is uploaded to the Retain server and appears in the list under Application Settings. The Application reflects what system Retain can connect to via REST.

Backing Up Retain

When you first set up Retain and dredge the email system you have two identical data sets.

When older items are deleted from the email system. That means Retain is the only repository of the data. When it comes to backups: "Two is one, one is none." That means if one fails, a backup remains or not. Depending on the type of your organization the legal ramifications of lost data can be significant.

Where Data Is Stored In Retain

There are only a few major places where data is stored in Retain. See "System File Locations" in *Retain 4.9.2: Planning*.

1. Program directory
2. Archive directory
3. Index directory (this may be on an external cluster)
4. Database directory (this may be on an external server)
5. Office 365 CSV files
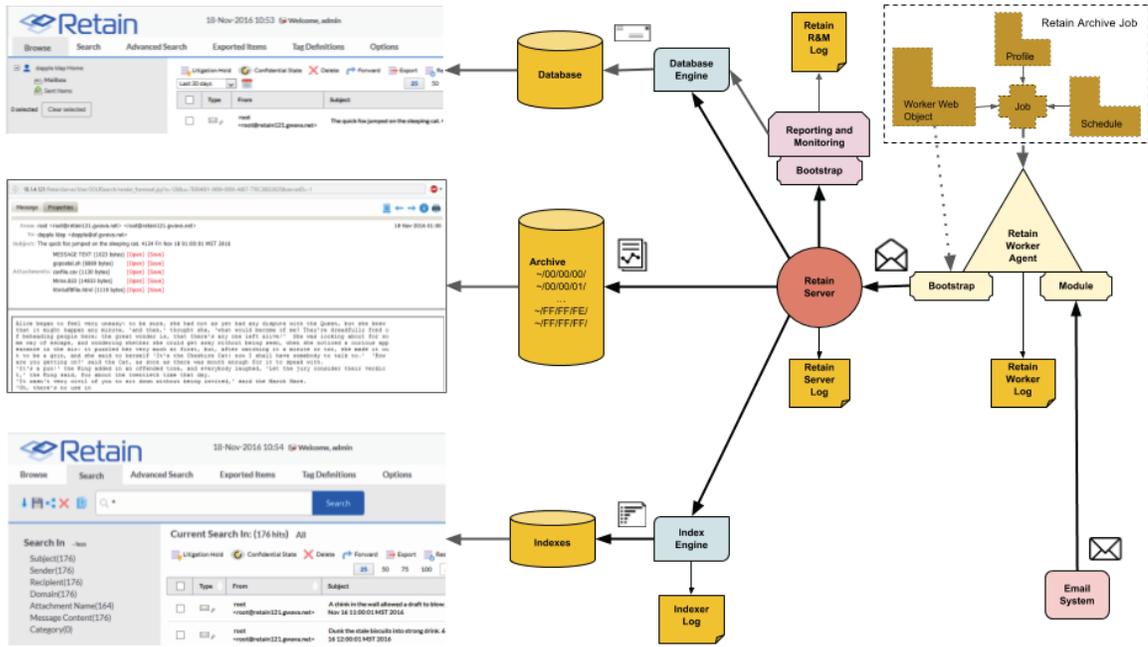

The Reporting and Monitoring Server data is stored in the database.

The Archive Job configuration is stored in the database.

Each major part of Retain keeps logs of what is happening the primary ones being the RetainServer, RetainWorker, Indexer and the Reporting and Monitoring log as RetainStatServer.

When you are interacting with Retain, depending on what you are doing you are viewing different parts of Retain the data.

- When you browse messages, you are viewing the metadata of the message that is stored in the database.
- When you search messages, you are viewing the indexes of the messages.
- When you open a message, you are viewing the message as saved on disk.

All message content and attachments to messages are stored on disk in the Retain storage area in a directory off of the "archive" directory (Server Configuration | Storage | Advanced). Every message and attachment gets assigned a "hash". Because the byte count of every message and file is unique, its hash value is unique. This is how Retain Server determines whether a message and/or attachment has already been processed and stored on disk when an archive job runs. That file's hash value is stored in the Retain database in the t_document and t_attachment tables.

The archive directory uses a load balancing strategy on disk. Thus, off the archive directory you'll find 256 two-digit subdirectories: 00 through FF. Each of those directories have their own set of 256 directories utilizing the same naming sequence (00 through FF). Additionally, those directories also have their own set of 256 subdirectories. Thus, if the filename were B4F05EECB7B21D9014A86C32291C913D190C33394365AC79ED3E1F6849532, you would find it under .../archive/B4/F0/5E.

When a user clicks on a message link in the Retain mailbox - whether from the Browse tab or the Search tab's search result list - Retain finds the file on disk and places the contents in the message window. If the original message was known to have text and the message window comes up blank, the file is missing from the location that Retain thinks it is in. This is extremely rare and usually only

happens as a result of moving the archive directory to a new location. In such cases, we find that either the files did not all copy over properly from the old location or the administrator forgot to tell Retain where the new location is at.

Backing Up Retain

The archive directory consists of up to approximately 16.7+ million directories and the archives are stored evenly across them. This makes it hard (if not impossible) for the traditional file-based backup systems to back it up; thus, you either need a disk image (block level) backup or you need to use a backup/restore solution of your choice.

The three most critical pieces that must be backed up are the archive data (specifically, the "archive" directory), the Retain database and the configuration files. Losing even one of those pieces would mean that your archive data is completely lost. They are interdependent. Indexes can be recreated, although that takes time.

Virtual Machines

If you are running Retain on a VM and if you are using a purchased version of VMWare at any level, the purchased version provides a disk backup utility. This can be used to back up Retain if the VM's local disks are part of the VM guest itself. However, those backups can also take a lot of time as the data grows, so even in those circumstances, you still may want to consider using a backup/restore solution of your choice.

If the disks are external to the VM guest, then those disks need to be backed up. This article assumes that the reader understands how disks work with VMs. If you do not fully understand virtual machine concepts, we recommend that you consult with the person that set up and maintains your VM environment.

Finding Retain's Storage Paths

To find your Retain system's storage paths, do the following:

1 Log in to the administrative web console (http://*ipaddress_or_DNS-hostname*/RetainServer).

2 Under Configuration, click **Server Configuration > Storage**.

3 Click Advanced Settings and deselect the **Derive all file locations from the above base path** (unless it is already deselected).

4 The list of storage paths displays.

NOTE: The information shown in the Storage tab in the Server Configuration screen is also stored in the `ASConfig.cfg` file.

What to Back Up

Other than backing up the archive directory structure, there are a few areas of Retain that are important to backup that would not require a disk image (block level) backup:

1. Configurations files
   - ASConfig.cfg
   - Indexer configuration files
2. Database (critical)
3. License
4. Index files (these can be rebuilt but that process can take days, weeks or months during which time your searches cannot produce full results)
5. Office 365 address book CSV files.

File Locations

1. Configuration files.
   - ASConfig.cfg is stored in a directory off of your Retain installation:

Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/cfg

Windows default: [Drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg

- Indexer configuration files (the entire directory's contents):

Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/solrweb/WEB-INF/cfg

Windows default: [Drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\solrweb\WEB-INF\cfg

2. Database.

- The location is too varied to mention here. Each customer should know where their Retain database resides.

3. License.

- The license directory is located under your storage path.

4. Indexes.

- Because the Index directory can be in a constant state of change, it is recommended that you back up the index subdirectory located beneath the backup directory (also found under the storage path).

- When the Retain maintenance routine runs, it makes a backup copy of the index directory and places it here. The frequency of this backup is configured in the RetainServer interface under Server Configuration | Maintenance.

5. Office 365 address book CSV files. These files can be found under the CSV path designated in Module Configuration | Exchange Module | Hosted Services.

If performing an upgrade of the Retain software you are strongly advised to manually back up all the files mentioned in this article before performing the upgrade.

Note on backing up during the nightly maintenance cycle:

In Retain 4.0.3 and higher the indexes are optimized during maintenance every night. This may take a hours after an upgrade. During optimization the index directory may grow by 2-3 times as temporary files are created and removed. Backing up during this time is not recommended.

General Maintenance

There are a few items of manual maintenance you need to do occasionally. Annually is usually sufficient.

- Remove **old logs** from the logs directory (Linux)/opt/beginfinite/retain/Tomcat[version]/logs or (Windows) Program Files/beginfinite/retain/Tomcat[version]/logs

- Remove **old deletion reports** from the archive directory. The file location can be found under Retain Web console | Server Configuration | Storage tab. If it is not under the base storage path, you may need to select Advanced settings and temporarily disable "Derive all file locations from above base path?"

- Remove **old exports** from the exports directory. The file location can be found under Retain Web console | Server Configuration | Storage tab. If it is not under the base storage path, you may need to select Advanced settings and temporarily disable "Derive all file locations from above base path?"

Un-installing Retain

To uninstall Retain, use the following general procedure. Actual locations may vary according to your specific setup, storage location, and host operating system.

Linux

1. Shut Down Tomcat: "service retain-tomcat8 stop"

2. Shut Down Apache: "service apache2 stop"

3. (Optional) Remove the data storage files

   Can be: /var/opt/beginfinite/retain. See the Retain Administration Guide section on storage to see where your data actually is placed.

4. Remove the program files

   Can be: /opt/beginfinite/retain

5. Remove the RetainWorker.xml, RetainServer.xml, RetainRouter.xml, and RetainStatsServer.xml from Tomcat

   Can be: /opt/beginfinite/retain/tomcat8/conf/Catalina/localhost

6. Remove the directories under tomcat/work (but NOT work itself)

   "rm –r /var/cache/retain-tomcat8/work/*"

7. Remove references to Retain in httpd.conf

   Can be: /etc/apache2/conf.d/retain-apache.conf

8. Remove tomcat service file: "rm /etc/init.d/retain-tomcat8"

9. If Apache and Tomcat were not removed, restart them both to verify that they load without problems.

Windows

1. Shut down Tomcat service

2. Remove Retain Tomcat 8 service

   Open a terminal as admin and type: "sc delete tomcat8"

3. Remove the program files

   Can be: C:\Program Files\Beginfinite\Retain

4. Remove the environment variables from the registry: RETAIN_CATALINA_HOME, RETAIN_HOME, RETAIN_JAVA_HOME, RETAIN_JAVA_VERSION, and RETAIN_JRE_HOME

5. (Optional) Remove the data storage files

   Can be: C:\Retain

6. (Optional) Remove SQL Database, SQL Server, Apache or IIS

Installing Other Retain Components on Linux

Deploying Production-Use Worker Agents on Linux

For all but small, all-in-one installations, best practice dictates having a Worker installed on each email, messaging, or other targeted system as applicable. For more information, see "Worker Locations" in *Retain 4.9.2: Planning*.

Installing Worker Agents

The Linux installer lets you install additional workers, one at a time.

1 Make sure the email or other server meets the "Retain Prerequisites for Linux Servers" on page 19.

2 Prepare the Retain installation software on the server as instructed in "Downloading and Preparing the Retain Installation Files on Linux" on page 19.

3 At the terminal prompt, enter the appropriate command for the worker instance you are installing on the server:

   3a First worker on server:

      `./RetainInstall.sh`

   3b Each additional worker:

      `./RetainInstall.sh addworker`

4 Accept the license agreement.

Type `q` to go directly to the acceptance options.

5 Acknowledge the system requirements by pressing Enter.

6 (First Worker only) By typing `n` or `y` as appropriate, choose to install only a Worker.

7 (Additional Workers only) Enter the number (1-9) of the Worker agent you wish to install. You can install workers in any order.

If you mistakenly enter a number that you have previously entered, before the install finishes, it asks whether you want to keep the same configuration, overwrite the configuration, or quit the installation.

8 For the Worker installation location, you can either confirm the standard install location (`/opt/beginfinite/retain`), change the installation path, or quit the installation.

9 For the Worker log file location, you can choose to keep the default log location at `/var/logs` or to store the log files in `/opt/beginfinite/retain/tomcat/logs`.

There is a separate log file for each worker, found in /var/log/retain-tomcat8/RetainWorker*N.yyyy-mm-dd*.log unless otherwise specified for this worker.

10 (First Worker only) The install checks for JDK 11 as described in "Access to the appropriate JDK running on the system:" on page 19.

11 Choose to run the `retain-tomcat` process on start-up or not.

NOTE: This choice affects Tomcat start-up for the server and any workers that you installed previously, not just the worker you are currently installing.

The installer completes the Worker configuration, displays information about accessing the worker in a browser, and provides some brief troubleshooting tips.

Creating Worker Web Objects and Downloading Worker Boostrap Files

After installing the Worker Agents for your Retain deployment, you need to connect them to the Retain Server by creating a Worker Web Object for each of them and downloading their respective bootstrap files.

1 After installing and acknowledging the location of the documentation, the installer shows you how to access the Workers that were just installed.

2 Using the password you set during the installation, log into the Retain web console as `admin`.

3 Create a new Worker and download the Bootstrap for each new Worker you installed. You may save it with a different name to organize it.

4 Browse to the new Worker at http://[ServerAddress]/RetainWorker*N*, where *N* is the number of the worker you just installed.

5 Upload the bootstrap.

6 Click Continue and log in to the worker.

7 Check the friendly name that it is the one you expect.

Installing a Retain Message Router on Linux

Install the Router on a separate Linux server in the DMZ to allow devices outside your network to archive to the Retain Server without exposing the server directly to the Internet.

1 Make sure the server meets the "Retain Prerequisites for Linux Servers" on page 19.

2 Prepare the Retain installation software on the server as instructed in "Downloading and Preparing the Retain Installation Files on Linux" on page 19.

3 If a previous version of Java was installed via YaST, tomcat may fail to start. Uninstall the existing Java with YaST and unset the JRE_HOME path (unset JRE_HOME).

4 Run the installer. Enter the following command: `./RetainInstall.sh`

5 When selecting the components to install. Select yes to "Install Retain Message Router" only.

6 Finish the install as normal.

7 Create a 10 GB data directory for the Router to use to temporarily use to store messages until they can be transferred to the Retain Server.

NOTE: The Storage Path must not be the same as the Mobile Module Data path.

---

8 Configure the Router in the Retain Server console under Configuration | Router Configuration. See "Retain Message Router Configuration Page" in *Retain 4.9.2: Configuration and Administration*.

9 The Router can be accessed by browsing to (case-sensitive): `http://[IPAddress or HostName]/RetainRouter`.

Installing Other Retain Components on Windows

- "Installing Additional Retain Workers on Windows" on page 48
- "Installing a Retain Message Router on Windows" on page 49

Installing Additional Retain Workers on Windows

Typically, one Worker Agent is installed on the Retain Server, but it may make sense for your system to use multiple workers.

One design option is to place a Worker Agent on each post office server, that would save network bandwidth as only new messages would be transmitted. Another option is to place multiple worker agents on a dedicated worker server.

Installing a worker agent is much simpler than installing the entire Retain server system. It only requires installing the web server and the worker agent software. It uses the same installer as above.

Prerequisite

Install the web server (IIS with ISAPI filter, as above)."Installing a Web Server" on page 8

Overview

In larger email systems, it can take a long time to dredge all the users especially if the users are on multiple mail servers. You can install multiple workers that can run in parallel to speed up the archiving process. We generally recommend one worker per mail server. The Retain installer can install up to 10 workers on a single server. We recommend an additional 1GB for RAM per worker. Workers are accessed by browsing to *http://[IPAddress or HostName]/RetainWorkerN*

The Retain installer allows you to install up to nine workers at once.

Procedure

1 Download and prepare the software on the Windows server as outlined in "Downloading and Preparing the Retain Windows Installation Source Files" on page 21.

2 Run the RetainInstall.exe and install at least one Worker or upgrade the existing installation, if you haven't already done so.

3 From the command line (run as Administrator), type RetainInstall.exe /AddWorker to start the installer in Add Worker Mode.

4 Acknowledge the requirements.

5 Accept the license agreement.

6 Confirm the install location of Retain.

7 Enter the number (1-9) of Worker agents to install. They are installed in numerical order (e.g. RetainWorker, RetainWorker1, RetainWorker2..., RetainWorker9).
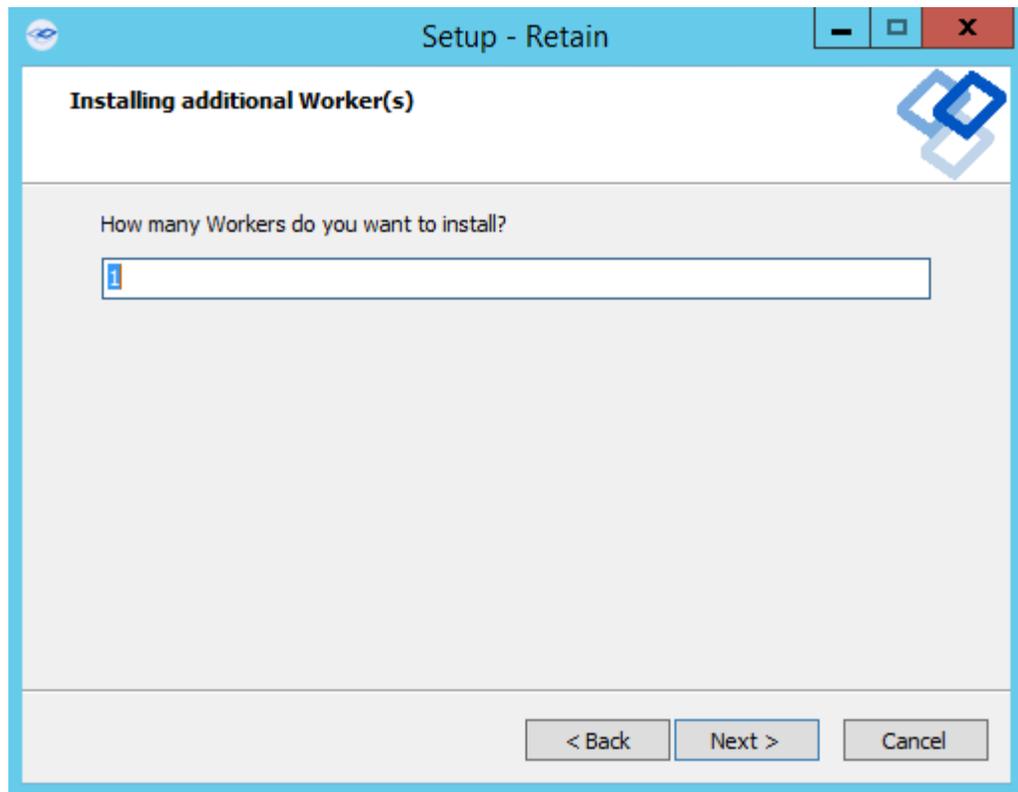

8 Confirm which webserver is installed.

9 Install the Worker agent software. After installing and acknowledging the location of the documentation the installer shows you how to access the Workers that were just installed.

10 Log into the Retain web console as admin

11 Create a new Worker and download the Bootstrap for each new Worker you installed. You may save it with a different name to organize it.

12 Browse to the new Worker at *http://[ServerAddress]/RetainWorkerN* where N is the number of the worker you just installed.

13 Upload the bootstrap.

14 Click Continue and login to the worker.

15 Check the friendly name that it is the one you expect.

There is a separate log file for each worker, found in *C:\Program Files\Beginfinite\Retain\Tomcat 8.0\logs\RetainWorkerN.yyyy-mm-dd.log* unless otherwise specified in Configure Tomcat.

Installing a Retain Message Router on Windows

The Retain Message Router allows devices outside your network to archive to the Retain Server without exposing the server directly to the Internet. The Router sits in your network's DMZ and routes items to the Retain Server.

The Router should be installed on a server other than the Retain server itself.

This is much simpler than installing the entire Retain server system. It only requires installing the webserver and the Router agent software. It uses the same installer as above.

Prerequisites:

- Install the web server (IIS with ISAPI filter, as above).
- Make sure that the Router server can connect to the Retain Server.

Install:

1 Download and prepare the software on the Windows server as outlined in "Downloading and Preparing the Retain Windows Installation Source Files" on page 21.

2 Extract the archive.

3 Run the installer, RetainInstall.exe, as above.

4 When selecting the components to install. Select "Message Router" only.

5 Finish the install as normal.

6 Create a 10 GB data directory for the Router to use to temporarily store messages until they can be transferred to the Retain Server.

    NOTE: The Storage Path must not be the same as the Mobile Module Data path.

7 Configure the Router in the Retain Server console under Configuration | Router Configuration. See "Retain Message Router Configuration Page" in *Retain 4.9.2: Configuration and Administration*.

8 The Router can be accessed by browsing to `http://[IPAddress or HostName]/ RetainRouter`.

Starting and Stopping the Retain Server

To start, stop, or restart Retain, you must start, stop, or restart Tomcat.

Windows

In Windows, Retain runs as a service. Open Services, select the Retain service then start, stop, or restart that service.
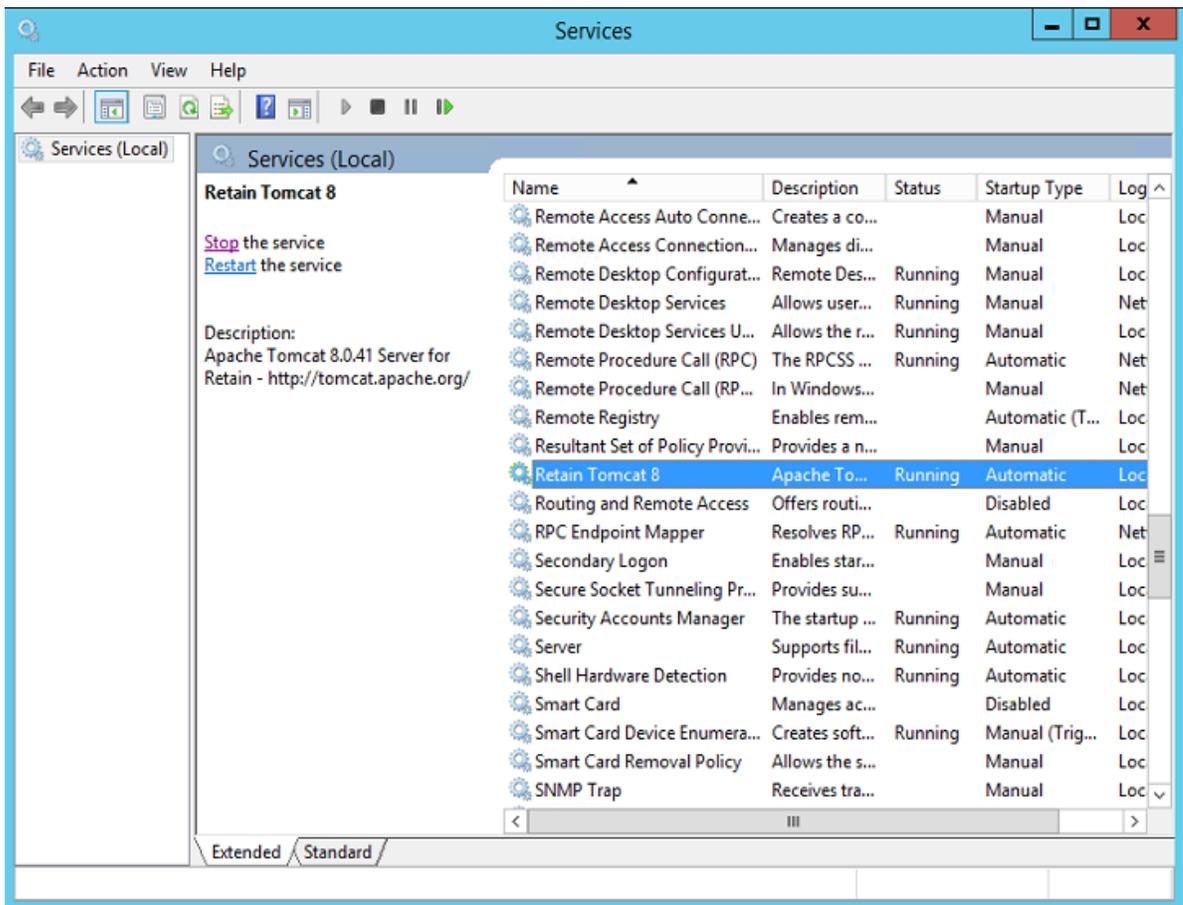

Linux

Use the following commands at the terminal prompt to start and stop Tomcat:

```
systemctl start retain-tomcat.service

systemctl stop retain-tomcat.service

systemctl restart retain-tomcat.service

systemctl status retain-tomcat.service
```

2 Upgrading to Retain 4.9.2

Retain Upgrade Path and Tasks
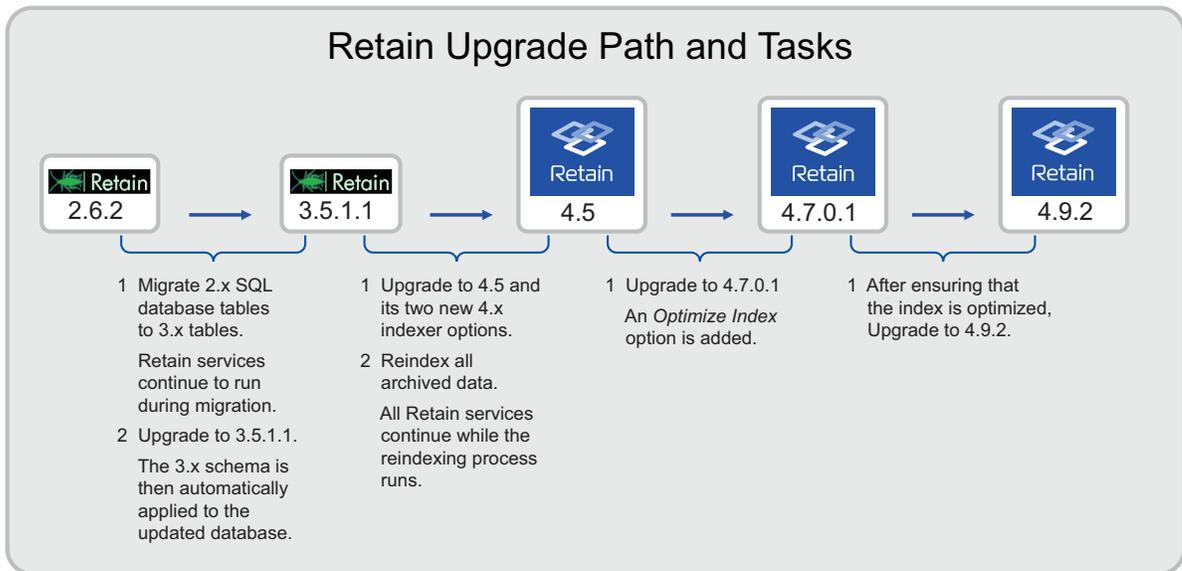

Do the following

1. Make sure you understand and follow the instructions in "Preparing to Upgrade to 4.9.2" on page 54.

2. Then start with the section where your current version fits. For example, 4.2 fits between 3.5.1.1 to 4.5.

3. Identify any steps that don't apply.

   For example, Retain 4.2 should be running the new Retain 4.*x* indexer, so you would skip the re-indexing process.

Use the instructions that follow to upgrade your system to Retain version 4.9.2.

- "Preparing to Upgrade to 4.9.2" on page 54
- "Upgrading from 2.6.2 to 3.5.1.1" on page 57
- "Upgrading from 3.5.1.1 (or 3.5.1) to 4.5" on page 73
- "Upgrading from 4.5 (or 4.4) to 4.7.0.1" on page 80
- "Upgrading from 4.7.0.1 to 4.9.2" on page 83
- "Moving Retain to a New Server" on page 87
- "Moving a MySQL Database to Another Server" on page 102
- "Upgrading MySQL to a New Version" on page 104

Preparing to Upgrade to 4.9.2

Prerequisites for Upgrading to 4.9.2

Before starting the upgrade processes, Micro Focus recommends that you make sure you have the requirements for a Retain 4.9.2 system, as outlined in "System Requirements" in *Retain 4.9.2: Planning*.

Using Sections That Show Two Starting Versions

Sections with two possible starting points, such as "Upgrading from 4.5 (or 4.4) to 4.7.0.1" on page 80, indicate that you can upgrade directly from either of the listed versions. For example, if you are running Retain 4.4, you can move directly to 4.7.0.1. You need not upgrade to 4.5 first.

Installing Java on a Server with no Internet Connection

By default, the Retain installation program uses an Internet connection to download a specific version of Java for each version of Retain. If the Retain server isn't connected to the Internet, you must prepare the server with a workaround beforehand. Otherwise, the installation fails.

The following sections outline the preparation steps for each Retain version in the supported upgrade path as well as for installing the current Retain release.

- "Linux Servers" on page 54
- "Windows Servers" on page 55

Linux Servers

Prepare your Linux Retain server by using the information in the row that matches your target version.

1 On a workstation with an Internet connection, use the links in the following table to download the linked Java version that applies to your upgrade target. Then refer to the Action column for further instructions.

Retain Platform and Version	Download and Copy These Files to Each Retain Server	Action

Linux 3.5.1.1	jdk-6u38-linux-x64.bin	1. On the Retain server that you are upgrading, create the following path:
		
		`/opt/beginfinite/retain/java6`
		
		2. Move the downloaded file to the `java6` directory.
		
		3. Make the file executable.
		
		4. Open a terminal prompt, navigate to the `java6` directory, and run the file by entering:
		
		`./jdk-6u38-linux-x64.bin`
		
		5. Press Enter when prompted.
		
		6. Continue with "2.6.2 to 3.5.1.1 on SLES" on page 57

Retain Platform and Version	Download and Copy These Files to Each Retain Server	Action
Linux 4.5	server-jre-8u162-linux-x64.tar.gz	1. When prompted about the missing JDK file, select option 3 and enter the path to the folder containing the file that you previously copied to the server. 2. Continue with the upgrade process.
Linux 4.7.0.1	OpenJDK10_x64_Linux_jdk-10.0.2.13.tar.gz	1. When prompted about the missing JDK file, select option 3 and enter the path to the folder containing the file that you previously copied to the server. 2. Continue with the upgrade process.
Linux 4.9.2	OpenJDK11U-jdk_x64_linux_hotspot_11.0.8_10.tar.gz	1. When prompted about the missing JDK file, select option 3 and enter the path to the folder containing the file that you previously copied to the server. 2. Continue with the upgrade process.

Windows Servers

Prepare your Windows Retain server by using the information in the row that matches your target version.

IMPORTANT: For Retain 3.5.1.1 and 4.7.0.1, you must manually extract Java and create or update three Retain System Variables, as outlined in the steps and tables that follow.

For Retain 4.5 and 4.9.2, you can either

 - Manually extract Java and set the system variables, like the other two Retain versions.

   Or

 - Copy the required Java file to the server before you run the installer (see the first two columns of the table in Step 1).

   In that case, extracting the file and setting environment variables is not required.

1 On a workstation with an Internet connection, use the links in the following table to download the linked Java versions that apply to your upgrade path. Then refer to the Action column for further instructions.

Retain Version	Download and Copy These Files to Each Server	Action
3.5.1.1	jdk-6u38-windows-x64.zip	1. Extract the files to this location: C:\Program Files\Beginfinite\Retain\Java6
4.5	jdk-8u162-windows-x64.zip	1. Extract the files to this location: C:\Program Files\Beginfinite\Retain\Java8
4.7.0.1	OpenJDK10_x64_Windows_jdk -10.0.2.13.zip	1. Extract the files to this location: C:\Program Files\Beginfinite\Retain\Java
4.9.2	OpenJDK11U- jdk_x64_windows_hotspot_11.0 .8_10.zip	1. Extract the files to this location: C:\Program Files\Beginfinite\Retain\Java

2 After extracting the files, before running the Retain installer, edit the system's Environment Variables to reflect the values indicated for the version you are upgrading to.

Retain Target Version	Variable Name	Value
Retain 3.5.1.1	RETAIN_JAVA_HOME	C:\Program Files\Beginfinite\Retain\Java6\jdk1.6.0_38
	RETAIN_JAVA_VERSIO N	1.6
	RETAIN_JRE_HOME	C:\Program Files\Beginfinite\Retain\Java6\jdk1.6.0_38\jre
Retain 4.5	RETAIN_JAVA_HOME	C:\Program Files\Beginfinite\Retain\Java8\jdk1.8.0_162
	RETAIN_JAVA_VERSIO N	1.8
	RETAIN_JRE_HOME	C:\Program Files\Beginfinite\Retain\Java8\jdk1.8.0_162/jre
Retain 4.7.0.1	RETAIN_JAVA_HOME	C:\Program Files\Beginfinite\Retain\Java\jdk-10.0.2+13
	RETAIN_JAVA_VERSIO N	1.10
	RETAIN_JRE_HOME	C:\Program Files\Beginfinite\Retain\Java\jdk-10.0.2+13
Retain 4.9.2	RETAIN_JAVA_HOME	C:\Program Files\Beginfinite\Retain\Java\jdk-11.0.8+10
	RETAIN_JAVA_VERSIO N	jdk-11.0.8+10
	RETAIN_JRE_HOME	C:\Program Files\Beginfinite\Retain\Java\jdk-11.0.8+10

3 When you run the Retain installer, it recognizes that Java is already installed.

Upgrading from 2.6.2 to 3.5.1.1

2.6.2 to 3.5.1.1 on SLES

Preparing for the Migration and Upgrade (SLES)

Table 2-1 *Preparing for Data Migration*

Task	Details
Make sure that the Retain server is connected to the Internet	1. Verify that the Retain server is connected to the Internet, so that the installer can download and upgrade Java to the correct version. If your server isn't connected to the Internet, see "Installing Java on a Server with no Internet Connection" on page 54.
Ensure SMTP Is Working in Retain	1. The Migration Tool must be able to email migration status messages. Otherwise, it will stop and display an error message.

Get the 3.5.1.1 software	1. Download the Retain 3.5.1.1 .zip file.
	
	2. Copy the file and unzip it on the following:
	
	   ◆ The Retain server that you are upgrading.
	
	   ◆ Every server that is running a Retain Worker.
	
	   ◆ The server from which you are running the Database Migration Tool if it's not the Retain server.

Decide where to run the Migration Tool	1. When possible, run the migration tool on the server where the database is running.
	
	2. If you need to run the migration from a separate server, do the following:
	
	   a. Copy the following file to the other server:
	
	     `/var/opt/beginfinite/retain/RetainServer/WEB-INF/cfg/ASConfig.cfg`
	
	   b. Note the file location on the other server so that you can specify it when you run the Database Migration Tool.

Task	Details
Ensure Adequate Disk Space	1. Database migration requires enough empty disk space to allow for: ◆ **~1 X current_database_size:** For a backup copy of the existing 2.*x* database. Plus ◆ **~1 X current_database_size:** For the new 3.*x* database, which is about the same size as the 2.*x* database. Or **Up to 10 X current_database_size (temporary, MySQL only):** MySQL query constraints and settings can cause the migration process to temporarily consume up to 10 times the current disk space. See the next step. 2. If you use a MySQL database or you require additional empty disk space for the migration to run, you can add a `tmpdir` setting to the `my.ini` file that points to a volume where there is available disk space. 3. If you use MS SQL or Oracle, make sure your DBA is aware of the need for temporary additional disk space.
Ensure Adequate RAM	1. Make sure the database server has enough RAM (ideally 18 GB). 2. Devote at least 1 GB RAM (preferably 8 GB) to the Migration Tool process, independent from the RAM used by the other processes running on the server.
If you use MySQL	Retain 2.6.2 specified MySQL 5.1 as the supported version. Although it is assumed that you have migrated your system to a later version in the interim, be aware that Retain 3.5.1.1 requires MySQL 5.5 or later.
Back up the Database and the Retain Server	The database migration should run smoothly. However, best practice always dictates backing up systems before making major changes. 1. Back up your database and the Retain server immediately before starting the database migration. If you need assistance identifying where Retain's components are stored, see "Finding Retain's Storage Paths" on page 42.

Task	Details

Make sure the database index is prepared	1. Make sure there is an index on the `recip_id` column in the `t_recp_properties` table.
	
	If this index does not exist, Recipient migrations take substantially longer.
	
	    ◆ For MySQL
	
	       1. Log in to MySQL and run this query:
	
	`show indexes from `*`database-name`*`.t_recp_properties \G`
	
	       2. If the recipients index is missing, create it with this query:
	
	          `CREATE INDEX idx_recip_id ON t_recp_properties (recip_id);`
	
	    ◆ For MS SQL
	
	       1. In SQL Server Management Studio, expand **Databases >** *your Retain database* **> dbo.t_recp_properties > Indexes**.
	
	       2. If the recipients index is missing, create it with this query:
	
	          `GO`
	
	          `CREATE NONCLUSTERED INDEX `*`idx_recp_value`*
	
	          `ON t_recp_properties (`*`recip_id`*`)`
	
	          `INCLUDE (`*`value`*`)`
	
	    ◆ For Oracle
	
	      Ask your Oracle DBA for assistance with determining the status of the recipients index.

Check for database fragmentation and rebuild if needed	**NOTE:** MySQL fragmentation issues are fixed during the Retain upgrade. If you use MySQL, you can skip to "Disable Transaction Logging."
	
	1. If your Retain deployment uses an MS SQL or Oracle database, check for fragmentation issues in the following indexes:
	
	    ◆ attachment
	    ◆ Document
	    ◆ Email
	    ◆ t_msg_properties
	    ◆ t_recipients
	    ◆ t_recp_properties
	
	For MS SQL
	
	  a. In SQL Server Management Studio, expand the indexes folder.
	
	  b. Double click an index to display its fragmentation percentage.
	
	  c. For indexes that require rebuilding, right click the index and choose the **Rebuild** option.
	
	For Oracle
	
	  a. Ask your Oracle DBA for assistance with checking and rebuilding indexes.

Task	Details
Disable Transaction Logging	Because Transaction Logs consume a lot of disk space, leaving logging enabled during migration could cause the system to run out of space.
	1. Assuming that you are backing up your database before starting the migration, Micro Focus strongly recommends that you disable Transaction Logging afterward, by doing the following:
	For MySQL
	a. Edit the `/etc/my.cnf` file.
	b. Insert a pound sign (#) at the beginning of the following line.
	`log-bin=mysql-bin`
	So that it reads
	`#log-bin=mysql-bin`
	c. Save the file.
	d. Make sure to restore the original setting after the migration completes.
	For MS SQL
	a. Access the Retain database properties, and change the recovery model to **Simple**.
	For more information, see Set Database Recovery Model (SQL Server) on Microsoft.com.
	b. Make sure to change the model back after the migration completes.
	For Oracle
	a. Consult with your Oracle database administrator.
Disable Jobs	Micro Focus recommends disabling archive jobs during the migration.
	Continuing to run Jobs during the migration process has been known to cause database racing conditions, which cause the migration tool to stop.
	Although the tool can be restarted when this happens, it is best to avoid potential issues with an interrupted migration.

Migrating the SQL Database from 2.*x* to 3.*x* (SLES)

Table 2-2 *Migrating the Database (SLES)*

Dialog/Section	Details
	1. Working as the `root` user, open a terminal prompt and navigate to the folder that you prepared in "Get the 3.5.1.1 software" on page 66.
	2. Enter the following command:
	`./RetainInstall.sh`
	The installation script asks whether this is an upgrade and presents four options as responses.

Dialog/Section	Details
Choose (1-4):	1. Type `2` and press Enter. The installation sets up the required version of Java and prepares a directory for running the data migration. The tool reports each action on the screen for your information.
Run Migration Program?	1. Type `Y` and press Enter.

Run Migration [y/n]?:	1. If your database is smaller than 150 GB, skip to the next row.
	
	If your database is larger than 150 GB, you need to increase the Java memory heap (assuming you have sufficient memory installed for the other services, such as the Retain server, database server, etc.).
	
	2. Type `n` and press Enter.
	
	3. In the folder that you prepared in "Get the 3.5.1.1 software" on page 66, open the `migrate3` folder.
	
	4. Edit the `MigrateConfig` file.
	
	5. Change the values for the following settings to allocate more RAM.
	
	Four GB (4096M) is the suggested minimum; eight GB (8192M) is optimal.
	
	    a. Change `Xms256M` to `Xms4096M` (minimum) or `Xms8192M` (optimal)
	
	    b. Change `Xmx1024m` to `Xmx4096m` (minimum) or `Xmx8192M` (optimal)
	
	6. Save the `MigrateConfig` file and close the editor.
	
	7. Enter the following command to run the migration tool.
	
	`./BeginMigration.sh`
	
	8. Skip the next row, then continue.

Run Migration [y/n]?:	1. Type `y` and press Enter.

Press ENTER	1. If you are running the Migration Tool on the Retain server, press Enter and continue with the next row.
	
	If you are not running the migration tool on the Retain server, you are prompted for the path to the `ASConfig.cfg` file.
	
	    a. Type the path to the `ASConfig.cfg` that you copied to the server in "Decide where to run the Migration Tool" on page 66.
	
	    b. Press Enter.

Dialog/Section	Details
Use GUI instead of Console [y]:	1. The program displays more tips regarding the `ASConfig.cfg` file, then prompts for three migration tool settings. ◆ **GUI instead of Console [n]:** Press Enter. ◆ **Refresh stats Interval (15 seconds):** Press Enter, or type a different interval and press Enter. ◆ **Exit automatically when migrated item count hits zero [n]:** Do not change the default. Press Enter. **WARNING:** Although the migration tool can run for as many cycles as needed to migrate all archived items, the tool itself can only be run one time. Because some organizations choose to keep their archiving jobs running for the first migration cycle (not a best practice), it is common that running jobs archive additional items in the 2.*x* database after the cycle ends. If you stop the migration tool when items are still being archived in 2.*x*, the additional items can't be migrated to 3.*x* and are effectively lost to Retain. If you must continue running jobs during the migration, you might consider stopping all jobs about one day before the migration concludes.In most cases you will then only need one additional cycle to confirm that everything has been migrated. You could also stop all jobs after the first cycle, and then run additional cycles until all items have been migrated. In all cases, do not choose the **Exit Immediately** option until all jobs have been stopped and the last migration cycle reports that no new items were archived. Otherwise, as already stated, items archived in the 2.*x* database but not migrated to 3.*x* are effectively lost.
Please verify all settings before choosing to proceed with the migration.	1. The program displays the configuration settings for your review, then lists 6 options: ◆ **1 Message Store settings:** Type 1 and press Enter if you need to adjust any of the message-store database access settings. ◆ **2 Configuration settings:** Type 2 and press Enter if you need to adjust any of the configuration database access settings. ◆ **3 Mailer settings:** Type 3 and press Enter if you need to adjust any of the SMTP settings. ◆ **4 Interface settings:** Type 4 and press Enter if you want to change any of the UI settings you specified earlier. ◆ **5 Proceed with Migration:** Type 5 and press Enter if you want to proceed with the migration. ◆ **6 Exit:** After you have started the migration tool, only type 6 when the most recent migration cycle showed no new items migrated. **TIP:** If the first migration cycle has not yet started, you can use this option to stop the migration tool and run the process later. The choices you have made are kept.

Dialog/Section	Details
	1. After you type 5 and press Enter, the migration tool does the following ◆ Upgrades the schema ◆ Checks the database version ◆ Disables deletion jobs ◆ Checks the SMTP configuration When all checks pass, you can press Enter to continue.
GWAVA Retain Migration	◆ Each step of the migration progress displays at the terminal prompt. **IMPORTANT:** Do not interrupt the migration process after it begins. Depending on the size of your archive, this process can require days, weeks, or even months to complete. However, assuming that you have followed the instructions in the previous sections, your Retain services will continue to function normally and the process should run well to completion. ◆ If any errors occur during the migration, see the migration log in the `Migrate3` directory for details. ◆ Fix the errors and run the job again by opening `BeginMigration.sh`. The migration picks up where it left off. ◆ If the system runs out of disk space, you must restore the 2.*x* database backup, fix the space problem and run the migration again. For assistance, contact Micro Focus support. ◆ If you are required to restore the 2.x database and start over for any reason, make sure to also do the following: 　1. Edit the `ASConfig.cfg` file. 　2. The previous migration attempt will have reset the `<storageEngine>` parameter to `database_process`. 　　Change the parameter to `standard` before rerunning the migration. ◆ When the migration finishes, Retain sends an email to notify that the first migration cycle completed.
After the first pass completes	1. If you haven't already done so, disable all Retain Jobs. 2. Click the **Wait 5 minutes for another pass** button. If you don't click the button, another pass runs in an hour.
When 0 items were migrated on the last pass	1. Wait for the next migration cycle to complete. 2. Check the status email. 3. If no new items were archived and all jobs are still disabled, the migration to the 3.x database is complete. If new items were archived, repeat from Step 2 in the previous row until the status email shows 0 items for the last cycle run. 4. When the migration reports that 0 items were migrated, type `1` and press Enter. The migration tool stops running.
Re-enable Transaction Logging and Retain Jobs	1. Re-enable Transaction Logging by reversing the changes that you made in "Disable Transaction Logging" on page 68. 2. Re-enable the Jobs that you disabled during migration process.

Upgrading to 3.5.1.1 (SLES)

Table 2-3 *Upgrade Retain to 3.5.1.1 (SLES*

Dialog/Section	Details

Retain Server Terminal Prompt	1. Working as the `root` user, at the terminal prompt, stop Apache and Tomcat.
	
	For example, on SLES 11 enter the following commands
	
	`rcapache2 stop`
	`rcretain-tomcat5 stop`
	
	2. Navigate to the folder that you prepared in "Get the 3.5.1.1 software" on page 66.
	3. Enter the following command:
	
	`./RetainInstall.sh.`
	
	4. Type `1` and press Enter to agree with the licensing agreement.

Choose (1-4):	1. If you have completed the database migration as instructed in "Migrating the SQL Database from 2.*x* to 3.*x* (Windows)" on page 68, type `3` and press Enter.
Choose (1-2):	1. Confirm the completed database migration by typing `1` and pressing Enter.
Install Retain Server (y/n)?	You are prompted for the components that apply to this server. 1. Type either `Y` or `N`, depending on whether the component indicated is installed on the server you are upgrading. 2. Press Enter and repeat.
Choose (1-3):	1. Confirm that you are upgrading and want to preserve the existing configurations by typing `1` and pressing Enter. Installation progress displays on the screen along with information about running the Retain components. When you are reminded to read the documentation and the system prompt appears, Retain has been successfully upgraded on this server.
System prompt	1. At the terminal prompt, start Tomcat. (Apache should be running already.) For example, on SLES 11 enter the following command: `rcretain-tomcat7 start`
Start Retain 3.5.1.1 for the First Time	1. In you management browser, access the Retain server's web administrative console: `http://ip_or_dns/RetainServer`

Dialog/Section	Details
Retain Database Schema	A message displays stating that the 3.*x* database schema enhancements require that the database be updated.
	1. Click the **Enter Credentials** button.
	2. Log in as the Retain administrator. A message in red text displays indicating that the database is being updated and the process should not be interrupted.
	3. When a green-text message indicates that the update is complete, Retain is ready for use.
	4. At the terminal prompt, restart Tomcat. For example, on SLES 11 enter the following command: `rcretain-tomcat5 start`
	5. Continue with "Upgrading from 3.5.1.1 (or 3.5.1) to 4.5" on page 73

2.6.2 to 3.5.1.1 on Windows

Preparing for the Migration and Upgrade (Windows)

Table 2-4   Preparing for Data Migration

Task	Details

Ensure an Internet Connection on the Retain server	1. Verify that the Retain server is connected to the Internet, so that the installer can upgrade Java to the correct version.
	
	If your server isn't connected to the Internet, you must download the required Java installation files. Do the following:
	
	  a. On a workstation with an Internet connection, download the required version of the Java installer to an Internet-connected workstation by clicking here.
	
	  b. Copy the downloaded .zip file to the following location on each server you are upgrading:
	
	    `C:\Program Files\Beginfinite\Retain\Java6`
	
	  c. When you run the Retain installer and the **Install Java** button displays, do not click the button. Just click **Next**.

Ensure SMTP Is Working in Retain	1. The Migration Tool must be able to email migration status messages. Otherwise, it will stop and display an error message.

Task	Details

Get the 3.5.1.1 software	1. Download the Retain 3.5.1.1 .zip file.
	
	2. Copy the file and unzip it on the following:
	
	   ◆ The Retain server that you are upgrading.
	
	   ◆ Every server that is running a Retain Worker.
	
	   ◆ The server from which you are running the Migration Tool if it's not the Retain server.

Decide where to run the Migration Tool	1. When possible, run the migration tool on the server where the SQL database is running.
	
	2. If you need to run the migration from a separate server, do the following:
	
	   a. Copy the following file to the other server:
	
	     `C:\Program Files\beginfinite\retain\RetainServer\WEB-INF\cfg\ASConfig.cfg`
	
	   b. Note the file location on the other server so that you can specify it when you run the Migration Tool.

Ensure Adequate Disk Space	1. SQL database migration requires enough empty disk space to allow for:
	
	   ◆ **~1 X current_database_size:** For a backup copy of the existing 2.*x* database.
	
	   Plus
	
	   ◆ **~1 X current_database_size:** For the new 3.*x* database, which is about the same size as the 2.*x* database.
	
	   Or
	
	   Up to 10 X current_database_size (temporary, MySQL only):
	
	   MySQL query constraints and settings can cause the migration process to temporarily consume up to 10 times the current disk space.
	
	   See the next step.
	
	2. If you use a MySQL database, or you require additional empty disk space for the migration to run, you can add a `tmpdir` setting to the `my.ini` file that points to a volume where there is available disk space.
	
	3. If you use MS SQL or Oracle, make sure your DBA is aware of the need for temporary additional disk space.

Ensure Adequate RAM	1. Make sure the database server has enough RAM (ideally 18 GB). 2. Devote at least 1 GB RAM (preferably 8 GB) to the Migration Tool process, independent from the RAM used by the other processes running on the server.
Back up the SQL Database and the Retain Server	The database migration should run smoothly. However, best practice always dictates backing up systems before making major changes. 1. Back up your SQL database and the Retain server immediately before starting the database migration. If you need assistance identifying where Retain's components are stored, see "Finding Retain's Storage Paths" on page 42.

Task	Details

Make sure the database index is prepared	1. Make sure there is an index on the `recip_id` column in the `t_recp_properties` table.
	
	If this index does not exist, Recipient migrations take substantially longer.
	
	    ◆ For MySQL
	
	        1. Log in to MySQL and run this query:
	
	`show indexes from database-name.t_recp_properties \G`
	
	        2. If the recipients index is missing, create it with this query:
	
	          `CREATE INDEX idx_recip_id ON t_recp_properties (recip_id);`
	
	    ◆ For MS SQL
	
	        1. In SQL Server Management Studio, expand **Databases >** *your Retain database* **> dbo.t_recp_properties > Indexes**.
	
	        2. If the recipients index is missing, create it with this query:
	
	          `GO`
	
	          `CREATE NONCLUSTERED INDEX idx_recp_value`
	
	          `ON t_recp_properties (recip_id)`
	
	          `INCLUDE (value)`
	
	    ◆ For Oracle
	
	    Ask your Oracle DBA for assistance with determining the status of the recipients index.

Check for database fragmentation and rebuild if needed	**NOTE:** MySQL fragmentation issues are fixed during the Retain upgrade. If you use MySQL, you can skip to "Disable Transaction Logging." 1. If your Retain deployment uses an MS SQL or Oracle database, check for fragmentation issues in the following indexes: ◆ attachment ◆ Document ◆ Email ◆ t_msg_properties ◆ t_recipients ◆ t_recp_properties **For MS SQL** a. In SQL Server Management Studio, expand the indexes folder. b. Double click an index to display its fragmentation percentage. c. For indexes that require rebuilding, right click the index and choose the **Rebuild** option. **For Oracle** a. Ask your Oracle DBA for assistance with checking and rebuilding indexes.

Task	Details
Disable Transaction Logging	Because Transaction Logs consume a lot of disk space, leaving logging enabled during migration could cause the system to run out of space.

1. Assuming that you are backing up your database before starting the migration, Micro Focus strongly recommends that you disable Transaction Logging after the backup finishes by doing the following:

   For MySQL

   a. Edit the `/etc/my.cnf` file.

   b. Insert a pound sign (#) at the beginning of the following line.

   `log-bin=mysql-bin`

   So that it reads

   `#log-bin=mysql-bin`

   c. Save the file.

   d. Make sure to restore the original setting after the migration completes.

   For MS SQL

   a. Access the Retain database properties and change the recovery model to **Simple**.

   For more information, see Set Database Recovery Model (SQL Server) on Microsoft.com.

   b. Make sure to change the model back after the migration completes.

   For Oracle

   a. Consult with your Oracle database administrator.

Task	Details
Disable Jobs	Micro Focus recommends disabling archive jobs during the migration.
	Continuing to run Jobs during the migration process has been known to cause database racing conditions, which cause the migration tool to stop.
	Although the tool can be restarted when this happens, it is best to avoid potential issues with an interrupted migration.

Migrating the SQL Database from 2.*x* to 3.*x* (Windows)

Table 2-5   Migrating the Database (Windows)

Dialog/Section	Details
	1. In the folder that you prepared in "Get the 3.5.1.1 software" on page 66, right click `RetainInstall.exe` and select **Run as Administrator**.
	2. Click **Next > Next**.
	Select the second option, **I'm upgrading from Retain 2.*x***.
Run Migration Installation Program?	1. Click **Yes**.
	The installer checks for the correct version of Java and its associated system variables and performs other preliminary actions, which it summarizes on the screen.

Dialog/Section	Details

Run Migration [y/ n]?:	1. If your database is smaller than 150 GB, skip to the next row.
	
	If your database is larger than 150 GB, you need to increase the Java memory heap (assuming that you have sufficient memory installed for the other services, such as the Retain server, database server, etc.).
	
	2. Type `n` and press Enter.
	
	3. In the folder that you prepared in "Get the 3.5.1.1 software" on page 66, open the `migrate3` folder.
	
	4. Right click the `MigrateConfig.bat` file and select **Edit**.
	IMPORTANT: Do not click **Open** or the batch file will run.
	
	5. Change the values for the following settings to allocate more RAM. Four GB (4096M) is the suggested minimum; eight GB (8192M) is optimal.
	
	   a. Change `Xms256M` to `Xms4096M` (minimum) or `Xms8192M` (optimal)
	
	   b. Change `Xmx1024m` to `Xmx4096m` (minimum) or `Xmx8192m` (optimal)
	
	6. Save the `MigrateConfig.bat` file and close the editor.
	
	7. In the `migrate3` directory, right click `BeginMigration.sh` and select `Open`.

Run Migration [y/ n]?:	1. Type `y` and press Enter.

Press ENTER	1. If you are running the Migration Tool on the Retain server, press Enter and continue with the next row.
	
	If you are not running the migration tool on the Retain server, you are prompted for the path to the `ASConfig.cfg` file.
	
	   a. Type the path to the `ASConfig.cfg` that you copied to the server in "Decide where to run the Migration Tool" on page 66.
	
	     For example, if you copied the file to the this server's desktop, the path might be `C:\Users\Administrator\Desktop\ASConfig.cfg`.
	
	   b. Press Enter.

Dialog/Section	Details
Use GUI instead of Console [y]:	1. The program displays more tips regarding the ASConfig.cfg file, then it prompts for three migration tool settings.
	◆ **GUI instead of Console:** Press Enter. Either choice is fine, but the GUI includes tabs, which make the information generated during the migration process much more usable.
	◆ **Refresh stats Interval (15 seconds):** Press Enter, or type a different interval and press Enter.
	◆ **Exit automatically when migrated item count hits zero [n]:** Do not change the default. Press Enter.
	WARNING: Although the migration tool can run for as many cycles as needed to migrate all archived items, the tool itself can only be run one time.
	Because some organizations choose to keep their archiving jobs running for the first migration cycle (not a best practice), it is common that running jobs archive additional items in the 2.*x* database after the cycle ends. If you stop the migration tool when items are still being archived in 2.*x*, the additional items can't be migrated to 3.*x* and are effectively lost to Retain.
	If you must continue running jobs during the migration, you might consider stopping all jobs about one day before the migration concludes.In most cases you will then only need one additional cycle to confirm that everything has been migrated.
	You could also stop all jobs after the first cycle, and then run additional cycles until all items have been migrated.
	In all cases, do not choose the **Exit Immediately** option until all jobs have been stopped and the last migration cycle reports that no new items were archived.
	Otherwise, as already stated, items archived in the 2.*x* database but not migrated to 3.*x* are effectively lost.
Please verify all settings before choosing to proceed with the migration.	1. The program displays the configuration settings for your review, then lists 6 options:
	◆ **1 Message Store settings:** Type 1 and press Enter if you need to adjust any of the message-store database access settings.
	◆ **2 Configuration settings:** Type 2 and press Enter if you need to adjust any of the configuration database access settings.
	◆ **3 Mailer settings:** Type 3 and press Enter if you need to adjust any of the SMTP settings.
	◆ **4 Interface settings:** Type 4 and press Enter if you want to change any of the UI settings that you specified earlier.
	◆ **5 Proceed with Migration:** Type 5 and press Enter if you want to proceed with the migration.
	◆ **6 Exit:** After you have started the migration tool, only type 6 when the most recent migration cycle showed no new items migrated.
	TIP: If the first migration cycle has not yet started, you can use this option to stop the migration tool and run the process later. The choices you have made are kept.

Dialog/Section	Details

	1. After you type 5 and press Enter, the migration tool does the following
	
	   ◆ Upgrades the schema
	
	   ◆ Checks the database version
	
	   ◆ Disables deletion jobs
	
	   ◆ Checks the SMTP configuration
	
	   When all checks pass, you can press Enter to continue.

GWAVA Retain Migration	1. Progress displays in either the GUI or the Command terminal, depending on your GUI choice.
	
	If you chose the GUI, a Java app opens and reports progress in three tabs:
	
	   ◆ **Statistics Tab:** During the migration, the Statistics tab displays the number of messages processed and the names of tables being migrated. it also shows the time that has elapsed for each table migration.
	
	   ◆ **Logs Tab:** If errors are listed, do the following:
	
	      1. Fix the errors.
	
	      2. Run the job again by opening `BeginMigration.sh`.
	
	         The migration picks up where it left off.
	
	   If the system runs out of disk space: You must do the following:
	
	      1. Restore the 2.*x* database backup.
	
	      2. Reset the ASConfig.cfg file, as follows:
	
	         a. Edit the `C:\Program Files\beginfinite\retain\RetainServer\WEB-INF\cfg\ASConfig.cfg` file.
	
	         b. Change the `<storageEngine>` parameter from `database_process` to `standard`.
	
	         c. Save the file.
	
	      3. Fix the disk space problem.
	
	      4. Run the migration again.
	
	   ◆ **Errors Tab:** If any errors occur during the migration, see the migration log in the `Migrate3` directory for details.
	
	NOTE: Do not close the Java window because that stops the migration.
	
	IMPORTANT: Do not interrupt the migration process after it begins.
	
	Depending on the size of your archive, this process can require days, weeks, or even months to complete.
	
	However, if you have followed the instructions in the previous sections, your Retain services will continue to function normally and the process should run well to completion.
	
	5. When the migration finishes, Retain sends an email to notify that the first migration cycle completed.

Pass Completed dialog	1. Disable all Retain Jobs (if you haven't already done it). 2. Click the **Wait 5 minutes for another pass** button. If you don't click the button, another pass runs in an hour.

Dialog/Section	Details
GWAVA Retain Migration	1. Wait for the next migration cycle to complete.
	2. Check the status email.
	3. If no new items were archived and all jobs are still disabled, the migration to the 3.x database is complete.
	If new items were archived, repeat from Step 2 in the previous row until the status email shows 0 items for the last cycle run.
	4. Click the **Exit Immediately** button, then click **Yes**.
	5. Click the **Migration Complete** button, then click **Yes**.
	6. In the Command Prompt window, press any key to exit.
Re-enable Transaction Logging and Retain Jobs	1. Re-enable Transaction Logging by reversing the changes that you made in "Disable Transaction Logging" on page 68.
	2. Re-enable the Jobs that you disabled for the database migration process.

Upgrading to 3.5.1.1 (Windows)

Table 2-6 *Upgrade Retain to 3.5.1.1 (Windows)*

Dialog/Section	Details
Retain Server Desktop	1. On the Retain server, click **Start > Administrative Tools > Services** (or the equivalent on your Windows server).
	2. Stop the **Apache Tomcat tomcat5** and **Apache 2.2** services.
	3. In the folder that you prepared in "Get the 3.5.1.1 software" on page 66, right click RetainInstall.exe and select **Run as Administrator**.
Setup - Retain	1. Click **Next > Next**.
Upgrading from a Previous Version?	1. You just finished migrating the database, so select the third option **I'm upgrading from Retain 2.x and data migration is completed** and click **Next**.
Confirmation	1. Select **Yes I'm absolutely certain. Please proceed** and click **Next**.
License Agreement	1. Accept the license agreement and click **Next**.
Select Destination Location	1. If your Retain installation is in a non-standard location, browse to the folder and click **Next**.
	Otherwise, accept the default location shown by clicking **Next**.
GWAVA Retain Migration	1. Select the services you are upgrading on this machine.
	2. Click **Next**.
Overwrite or Upgrade	1. Leave the Upgrade option selected and click **Next.**
Java Installation	1. Click the **Install Java** button.
	A command prompt window opens, then Java downloads and installs.
	When the installation finishes the window closes.
	2. Click **Next**.

Dialog/Section	Details
Tomcat Installation	1. Click **Install Tomcat**. A command prompt window opens, then Tomcat downloads and installs. When the installation finishes the window closes. 2. Click **Next**.
Choose a Web Server	1. Select the Web server you have installed and configured, then click **Next**. **NOTE:** If you are using Apache 2.2 and get an error that the directory is incorrect, browse to the correct path, then click Next.
AJP Port	1. Accept or modify the AJP port used on this network, then click **Next**.
Ready to Install	1. Click **Install**. The Retain software upgrades to version 3.5.1.1.
Information	1. Click **Next**.
General Information	1. Information about accessing Retain displays. Click **Next > Finish**.
Enable Tomcat and Apache	1. On the Retain server, click **Start > Administrative Tools > Services** (or the equivalent on your Windows server). 2. Start the **Apache Tomcat 7.0 tomcat7** and **Apache 2.2** services.
Start Retain 3.5.1.1 for the First Time	1. In you management browser, access the Retain server's web admin console: `http://`*`ip_or_dns`*`/RetainServer`
Retain Database Schema	A message displays stating that the 3.*x* database schema enhancements require that the database be updated. 1. Click the **Enter Credentials** button. 2. Log in as the Retain administrator. A message in red text displays indicating that the database is being updated and the process should not be interrupted. 3. When a green-text message displays indicating that the update is complete, Retain is ready for use. 4. Access **Start > Administrative Tools > Services** and restart Tomcat 7.

Upgrading from 3.5.1.1 (or 3.5.1) to 4.5

Preparing to Upgrade to 4.5

Table 2-7   *Preparing for Retain 4.5*

Task	Details
Ensure that the Retain server is connected to the Internet	1. Verify that the Retain server is connected to the Internet, so that the installer can upgrade Java to the correct version. If your server isn't connected to the Internet, see "Installing Java on a Server with no Internet Connection" on page 54.
Ensure that SMTP Is Working in Retain	1. The installer must be able to email status messages to the configured SMTP account. Otherwise, it will stop and display an error message.
Get the 4.5 software	1. Download the Retain 4.5 .zip file. 2. Copy the file and unzip/extract it on the following: ◆ The Retain server that you are upgrading. ◆ Every server that is running a Retain Worker or other component. 3. (SLES) Open a terminal, navigate to the extracted folder, run the following command to make the script files executable: `chmod +x *.sh`
Decide which Indexer to Use	1. Decide whether to use the standard indexer or high-availability, cluster-based index servers (separate license required). **NOTE:** For most Retain deployments including large enterprises, the standard indexer is more than adequate. If your organization requires a high-availability, clustered index-server deployment, visit the Micro Focus Gwava Customer Center and contact your Micro Focus Sales Consultant.
Get 4.0 Licenses	1. Using the Micro Focus Gwava Customer Center, obtain licenses for Retain 4.*x* and the 4.*x* modules, etc. that your Retain deployment uses.
Ensure Adequate Disk Space for Reindexing	1. Deploying the new indexer requires enough empty disk space to allow for 4 times the current index size. The installer checks this and warns if the empty space is lower, but it doesn't stop you from proceeding at your own risk. If you need assistance identifying where the index and other Retain components are stored, see "Finding Retain's Storage Paths" on page 42.
Ensure Adequate RAM	1. Make sure that the Retain server has at least 12 GB RAM.
GroupWise Storage Flags	1. If you archive GroupWise, note which storage flags Retain is currently using. You will nave an opportunity to set them after the upgrade completes and before you reindex the Retain archive.
Back up the Database and the Retain Server	The upgrade should run smoothly. However, best practice always dictates backing up systems before making major changes. 1. Back up your database and the Retain server immediately before starting the upgrade.

Upgrading to 4.5 (SLES)

If you are upgrading Retain on a Windows server, go to

Table 2-8   Upgrading to 4.5 on SLES

Installation Section	Details
Stop Retain before Upgrading	1. On the Retain server, open a terminal prompt. 2. Stop Retain by stopping the **Apache Tomcat** service. For example, on SLES 11 enter the following command: `rcretain-tomcat7 stop`
Run the Retain 4.5 Installation	1. At the terminal prompt, navigate to the folder that you prepared in "Get the 4.5 software" on page 74, then enter the following command: `./RetainInstall.sh`
License Agreement	1. Scroll through the license agreement, then type `1` and press Enter.
Software and RAM Requirements	The Linux install lists the 4.5 software and RAM requirements. 1. Press Enter to continue.
Retain Component Selection	The install displays the Retain components that are already installed on the server. 1. If you want to upgrade only the listed components, enter `1`. 2. If you want to also install additional components, enter `2`, then enter `y` for the components you wish to add to the server.
Java, Tomcat, and Apache	The install checks for Java 8 and Tomcat 8. If they are not installed, it installs and configures them for Retain. The install then verifies that a supported version of Apache is installed. **NOTE:** If desired, you can review the actions just taken by scrolling through the displayed text before continuing.
Overwrite or Upgrade Retain	The install displays the location of the existing Retain installation and gives three options. You want to upgrade Retain and keep the current configuration 1. Type `1` and press Enter.
Upgrade the Retain Components	The installation process extracts and installs Retain 4.5. Then it starts the required processes. A message thanks you for installing Retain and reminds you to consult the documentation. When the system prompt displays, wait a few moments to make sure all the components are running, then continue with "Completing the Upgrade to Retain 4.5" on page 77.

Upgrading to 4.5 (Windows)

If you are upgrading Retain on a SLES server, go to

Table 2-9 *Upgrading to 4.5 on Windows*

Dialog/Section	Details
Stop Retain before Upgrading	1. On the Retain server, click **Start > Administrative Tools > Services** (or the equivalent on your version of Windows Server). 2. Stop Retain by stopping the **Apache Tomcat 7.0 tomcat7** service.
Run the Retain 4.5 Installation	1. In the folder that you prepared in "Get the 4.5 software" on page 74, right click `RetainInstall.exe` and select **Run as Administrator**.
Welcome to the Retain Setup Wizard	1. Click **Next**.
Software Requirements	The install lists the 4.5 software and hardware requirements along with the software that it will install 1. Click **Next**.
License Agreement	1. Accept the agreement and click **Next**.
Select Destination Location	1. If you want to install the upgraded Retain components in a non-default location, use the Browse button to change the path. 2. Click **Next**.
Retain Components Selection Page	The install displays the components that are already installed on the server. 1. If desired, you can select additional components for installation. 2. Click **Next**.
Pre-requirements Status	1. The install checks for Java 8 and Tomcat 8. If they are not installed, it indicates that they will be. 2. Click **Next**. The install runs the Java 8 and Tomcat 8 installations and configurations. Click through or run any security alerts or other dialogs to complete the installation.

Choose a Web Server	1. Select the Web server that Retain uses.
	2. If you use IIS, click **Next** and continue with the next row in this table.
	3. If you use Apache,
	    a. Browse to and select where it is installed.
	    b. Click **Next**.
	    c. If needed, adjust the AJP port.
	    d. Click **Next**.

Overwrite or Upgrade Retain	1. Leave the Upgrade option selected. 2. Click **Next**.
Ready to Install	1. Click the **Install** button. The installation process extracts and installs Retain 4.5. Then it starts the required system processes.
Information	The install reminds you to consult the documentation. 1. Wait a few moments for all of the components to finish installing. 2. Click **Next**.

Dialog/Section	Details
General Information	A message shows the Retain access URL. 1. Click **Next**.
Completing the Retain Setup Wizard	1. Click **Finish**. 2. Continue with "Completing the Upgrade to Retain 4.5" on page 77.

Completing the Upgrade to Retain 4.5

You must complete the tasks in the following sections in order to have a fully functional Retain 4.5 System

Updating the Schema and Installing Retain 4 Licenses

Table 2-10   Completing the Upgrade to 4.5

Dialog/Section	Details
	1. In your administrative browser, open Retain's web admin console and log in as the Retain admin.
Configuration Database Schema Enhanced	A message displays stating that the Configuration Database schema requires updating. 1. Click the **Enter Credentials** button. 2. Log in as the Retain admin user. Red text displays with a progress indicator. 3. When green text indicates that the schema is updated, restart the **Retain Tomcat 8** service. **SLES 11:** On the server at a terminal prompt, enter `rcretain-tomcat8 restart`. **Windows:** On the server at a terminal prompt, enter In the Services manager, restart **Retain Tomcat 8**. 4. Wait a few moments for Tomcat to restart, then refresh the browser.

Dialog/Section	Details
Database Schema Enhanced	**IMPORTANT:** At first glance, the refreshed screen might look like the previous prompt has looped back. However, this refers to the schema of the SQL database that tracks the message store archive. The previous item dealt with the SQL database that tracks Retain's configuration settings, etc. 1. Click the **Enter Credentials** button. 2. Log in as the Retain admin user. Red text displays with a progress indicator. 3. When green text indicates that the schema is updated, restart the **Retain Tomcat 8** service as before. 4. Wait a few moments for Tomcat to restart, then refresh the browser.
Retain Login Dialog	1. Log in as the Retain admin user.
Licensing	1. In the web administration console under **Configuration**, click **Licensing**. The **Licensing** page opens. 2. Under **Submit License**, choose and submit each of your Retain 4.0 licenses. 3. Although not required, you might consider removing the expired licenses to clean up the page and make it easier to manage your current licenses going forward. 4. Continue with "If Your System Began at Version 3.0 or Earlier" on page 78.

If Your System Began at Version 3.0 or Earlier

If your initial Retain system was version 3.0 or earlier, do the following:

Item	Action
Server Logging Level	1. In the browser-based administrative console, navigate to **Configuration > Server Configuration > Logging**. 2. Set the Server Logging Level to **Diagnostic**, unless your root partition disk space is limited. 3. Save the change.
Worker Logging Level	1. In the browser-based administrative console, navigate to **Data Collection > Workers >** *Worker object* **> Logging**. 2. Set to **Diagnostic**, unless your root partition disk space is limited.
Indexing	1. Be aware that the Retain 4.5 default is to index all content. If you don't want all content indexed, adjust the settings before running the tasks in "Reindexing Retain" on page 79.

Item	Action
Worker Performance	1. In the browser-based administrative console, navigate to **Data Collection > Workers > *Worker object* > Connection tab**.
	2. Make sure the port is set to 48080. Older systems defaulted to 80, which routes through the web server and slows the system down.
	3. Avoid using SSL if your organization security policies allow it. SSL cuts worker performance in half.
	4. If you change any of your Workers' configuration settings, make sure that you copy new Bootstrap files to `/opt/beginfinite/retain/RetainWorker/WEBINF/cfg` and restart the worker.
GroupWise Storage Flags	1. If you archive GroupWise, as part of the planning process you noted which storage flag Retain uses in "GroupWise Storage Flags" on page 74.
	2. Access the GroupWise module and set the storage flags to match the previous settings.
Reporting & Monitoring Server and System Resources	1. If applicable to your deployment, you can prevent the server from draining system resources by selecting **Core Settings > Disable the disk usage statistic** option.
	2. Also set the port under the Connection tab to 48080.

Reindexing Retain

NOTE: The instructions in this section assume that you are using the Retain 4 Standard Indexer. If you are deploying a high-availability cluster for indexing, your Sales representative is working with you on that deployment and you can ignore this section.

Table 2-11   Reindexing with the Retain 4 Indexing Engine

Dialog/Section	Details
Reindexing	After the system is running with updated licenses, it's time to create new indexes of all the message store metadata, using the Retain 4 indexers.
	1. In the web administrative console, go to **Configuration > Server Configuration > Index**.
	2. Under **Indexing Engine**, click the **Migrate to 4.0 Indexer** button. The **Configure New Indexer** subpanel opens.
	3. Type the Retain Admin password.
	4. Click **Save Changes**. The reindexing process begins and the screen refreshes regularly to show progress. All user services are still functional during this time. **WARNING:** Do not interrupt the reindexing process.
General Information	1. When the reindexing of all message store meta data is complete, Retain sends an email.
	2.

Removing Old Indexes after Retain 4.5 Has Completed Re-indexing

1 In the browser-based management console, go to **Configuration > Server Configuration > the Storage tab**.

2 In the **Storage** panel, click **Advanced Settings**. and if the **Derive all file locations …** option is selected, deselect it.

3 Note the **Index** path.

4 Delete all of the files in the location shown *except* the `solrhome` directory.

Upgrading from 4.5 (or 4.4) to 4.7.0.1

The following points apply to Retain 4.7.0.1:

- It prepares the message store database for a schema change that Retain 4.9.2 implements.
- It contains an important upgrade to the Retain indexer.
- It facilitates an immediate upgrade to 4.9.2 through a new **Optimize Index Now** button.

Preparing to Upgrade to 4.7.0.1

Table 2-12   Preparing for Retain 4.7.0.1

Task	Details
Ensure that the Retain server is connected to the Internet	1. Verify that the Retain server is connected to the Internet, so that the installer can upgrade Java to the correct version. If your server isn't connected to the Internet, see "Installing Java on a Server with no Internet Connection" on page 54.
Ensure that SMTP Is Working in Retain	1. The installer must be able to email status messages to the configured SMTP account. Otherwise, it will stop and display an error message.

Get the 4.7.0.1 software	1. Download the Retain 4.7.0.1 .zip file.
	
	2. Copy the file and unzip/extract it on the following:
	
	  - The Retain server that you are upgrading.
	
	  - Every server that is running a Retain Worker or other component.
	
	3. (SLES) Open a terminal, navigate to the extracted folder, run the following command to make the script files executable:
	
	`chmod +x *.sh`

Ensure Adequate RAM	1. Make sure that the Retain server has at least 12 GB RAM.
Back up the Database and the Retain Server	The upgrade should run smoothly. However, best practice always dictates backing up systems before making major changes. 1. Back up your database and the Retain server immediately before starting the upgrade.

Upgrading to 4.7.0.1 (SLES)

If you are upgrading Retain on a Windows server, go to "Upgrading to 4.7.0.1 (Windows)" on page 81

Table 2-13 *Upgrading to 4.7.0.1 on SLES*

Installation Section	Details
Stop Retain before Upgrading	1. On the Retain server, open a terminal prompt. 2. Stop Retain by stopping the **Apache Tomcat** service. For example, on SLES 11 enter the following command: `rcretain-tomcat8 stop`
Run the Retain 4.7.0.1 Installation	1. At the terminal prompt, navigate to the folder that you prepared in "Get the 4.7.0.1 software" on page 80, then enter the following command: `./RetainInstall.sh`
License Agreement	1. Scroll through the license agreement, then type 1 and press Enter.
Software and RAM Requirements	The Linux install lists the 4.7.0.1 software and RAM requirements. 1. Press Enter to continue.
Retain Component Selection	The install displays the Retain components that are already installed on the server. 1. If you want to upgrade only the listed components, enter 1. 2. If you want to also install additional components, enter 2, then enter y for the components you wish to add to the server.
Java, Tomcat, and Apache	The install checks for Java 10 and Tomcat 8.5. If they are not installed, it installs and configures them for Retain. **NOTE:** The Java and Tomcat verification/installation process can take a while, so be patient while the installation works in the background. The install then verifies that a supported version of Apache is installed. **NOTE:** If desired, you can review the actions just taken by scrolling through the displayed text before continuing.
Overwrite or Upgrade Retain	The install displays the location of the existing Retain installation and gives three options. You want to upgrade Retain and keep the current configuration 1. Type 1 and press Enter.
Upgrade the Retain Components	The installation process extracts and installs Retain 4.7.0.1. Next, it starts the system processes that Retain requires. Finally, a message reminds you to consult the documentation. When the system prompt displays, wait a few moments to make sure all the components are running, then continue with "Upgrading from 4.7.0.1 to 4.9.2" on page 83.

Upgrading to 4.7.0.1 (Windows)

If you are upgrading Retain on a SLES server, go to "Upgrading to 4.7.0.1 (SLES)" on page 81

Table 2-14 *Upgrading to 4.7.0.1 on Windows*

Dialog/Section	Details
Stop Retain before Upgrading	1. On the Retain server, click **Start > Administrative Tools > Services** (or the equivalent on your version of Windows Server). 2. Stop Retain by stopping the **Apache Tomcat 8** service.
Run the Retain 4.7.0.1 Installation	1. In the folder that you prepared in "Get the 4.7.0.1 software" on page 80, right click `RetainInstall.exe` and select **Run as Administrator**.
Welcome to the Retain Setup Wizard	1. Click **Next**.
Software Requirements	The install lists the 4.7.0.1 software and hardware requirements along with the software that it will install 1. Click **Next**.
License Agreement	1. Accept the agreement and click **Next**.
Select Destination Location	1. If you want to install the upgraded Retain components in a non-default location, use the Browse button to change the path. 2. Click **Next**.
Retain Components Selection Page	The install displays the components that are already installed on the server. 1. If desired, you can select additional components for installation. 2. Click **Next**.
Pre-requirements Status	1. The install checks for Java 10 and Tomcat 8.5. If they are not installed, it indicates that they will be. 2. Click **Next**. The install runs the Java 10 and Tomcat 8.5 installations and configurations. Click through any security alerts or other dialogs to allow the process to run to completion.

Choose a Web Server	1. Select the Web server that Retain uses.
	2. If you use IIS, click **Next** and skip to the next row.
	3. If you use Apache,
	    a. Browse to and select where it is installed.
	    b. Click **Next**.
	    c. If needed, adjust the AJP port.
	    d. Click **Next**.

Overwrite or Upgrade Retain	1. Leave the Upgrade option selected. 2. Click **Next**.
Ready to Install	1. Click the **Install** button. The installation process extracts and installs Retain 4.7.0.1. Then it starts the required system processes.
Information	The install reminds you to consult the documentation. 1. Wait a few moments to make sure all components have finished installing. 2. Click **Next**.

Dialog/Section	Details
General Information	A message shows the Retain access URL. 1. Click **Next**.
Completing the Retain Setup Wizard	1. Click **Finish**. The upgrade to Retain 4.7.0.1 is complete.

Upgrading from 4.7.0.1 to 4.9.2

Use the instructions in the following sections to upgrade from Retain 4.8.1 or later to Retain 4.9.2.

- "Preparing to Upgrade to 4.9.2" on page 83
- "Upgrading to 4.9.2 (SLES)" on page 84
- "Upgrading to 4.9.2 (Windows)" on page 85
- "Updating the 4.9.2 Database Schema" on page 86

Preparing to Upgrade to 4.9.2

Table 2-15   Preparing for Retain 4.9.2

Task	Details
If you archive Office 365 using Basic Authentication	Be aware of the following points: ◆ Basic Authentication is no longer supported, beginning with Retain 4.9.2. The upgrade will succeed with Basic Authentication still in place. However, you should switch to OAuth as soon as possible. ◆ Each time you log in to the administrative console, a pop up message displays reminding you that an O365 module is using basic authentication and that you need to switch OAuth authentication to ensure continued data archiving. ◆ If the system uses Retain's SMTP notification system, when you run a maintenance job, the system sends an alert email to the designated recipient with the subject "Retain Alert - Basic Authentication Not Supported."
Ensure that the Retain index has been optimized	By default, Retain optimizes its index at 1 a.m. every Sunday morning. To make sure that your system's index has been optimized since upgrading to version 4.7.0.1, do the following: 1. In the web administrative console, go to **Configuration > Server Configuration > Maintenance tab > Maintenance/Caching panel**. 2. Check the **Last Index Optimization** date. 3. If the last optimization occurred before the upgrade to Retain 4.7.0.1, click the Optimize Now button and wait until the date changes before proceeding.
Ensure that the Retain server is connected to the Internet	1. Verify that the Retain server is connected to the Internet, so that the installer can install OpenJDK 11. If your server isn't connected to the Internet, see "Installing Java on a Server with no Internet Connection" on page 54.

Task	Details
Ensure that SMTP Is Working in Retain	1. The installer must be able to email status messages to the configured SMTP account. Otherwise, it will stop and display an error message.
Get the 4.9.2 software	1. Download the Retain 4.9.2 .zip file. 2. Copy the file and unzip/extract it on the following: ◆ The Retain server that you are upgrading. ◆ Every server that is running a Retain Worker or other component. 3. (SLES) Open a terminal, navigate to the extracted folder, run the following command to make the script files executable: `chmod +x *.sh`
Ensure Adequate RAM	1. Make sure that the Retain server has at least 12 GB RAM.
Back up the Database and the Retain Server	The upgrade should run smoothly. However, best practice always dictates backing up systems before making major changes. 1. Back up your database and the Retain server immediately before starting the upgrade.

Upgrading to 4.9.2 (SLES)

If you are upgrading Retain on a Windows server, go to "Upgrading to 4.7.0.1 (Windows)" on page 81

Table 2-16 Upgrading to 4.9.2 on SLES

Installation Section	Details
Stop Retain before Upgrading	1. On the Retain server, open a terminal prompt. 2. Stop Retain by stopping the **Apache Tomcat** service. For example, on SLES 11 enter the following command: `rcretain-tomcat stop`
Run the Retain 4.9.2 Installation	1. At the terminal prompt, navigate to the folder that you prepared in "Get the 4.9.2 software" on page 84, then enter the following command: `./RetainInstall.sh`
License Agreement	1. Scroll through the license agreement, then type 1 and press Enter.
Software and RAM Requirements	The Linux install lists the 4.9.2 software and RAM requirements. 1. Press Enter to continue.
Retain Component Selection	The install displays the Retain components that are already installed on the server. 1. If you want to upgrade only the listed components, enter 1. 2. If you want to also install additional components, enter 2, then enter y for the components you wish to add to the server.

Installation Section	Details
Java, Tomcat, and Apache	The install checks for OpenJDK 11 and an updated version of Tomcat 8.5. If they are not installed, it installs and configures them for Retain.

NOTE: The Java and Tomcat verification/installation process can take a while, so be patient while the installation works in the background.

The install then verifies that a supported version of Apache is installed.

NOTE: If desired, you can review the actions just taken by scrolling through the displayed text before continuing. |
| **Overwrite or Upgrade Retain** | The install displays the location of the existing Retain installation and gives three options. You want to upgrade Retain and keep the current configuration

1. Type `1` and press Enter. |
| **Upgrade the Retain Components** | The installation process extracts and installs Retain 4.9.2.

Next, it starts the system processes that Retain requires.

Finally, a message reminds you to consult the documentation.

1. When the system prompt displays, wait a few moments to make sure all the components are running.
2. Then continue with "Updating the 4.9.2 Database Schema" on page 86 |

Upgrading to 4.9.2 (Windows)

If you are upgrading Retain on a SLES server, go to "Upgrading to 4.9.2 (SLES)" on page 84

Table 2-17   Upgrading to 4.9.2 on Windows

Dialog/Section	Details
Stop Retain before Upgrading	1. On the Retain server, click **Start > Administrative Tools > Services** (or the equivalent on your version of Windows Server).
2. Stop Retain by stopping the **Retain Tomcat** service.
Run the Retain 4.9.2 Installation	1. In the folder that you prepared in "Get the 4.9.2 software" on page 84, right click `RetainInstall.exe` and select **Run as Administrator**.
Welcome to the Retain Setup Wizard	1. Click **Next**.

2. Click **Next**. |

Dialog/Section	Details
Retain Components Selection Page	The install displays the components that are already installed on the server. 1. If desired, you can select additional components for installation. 2. Click **Next**.
Pre-requirements Status	1. The install checks for OpenJDK 11 and an updated Tomcat 8.5. If they are not installed, it indicates that they will be. 2. Click **Next**. The install runs the OpenJDK 11 installation and updates Tomcat 8.5. Click through any security alerts or other dialogs to allow the process to run to completion.

Choose a Web Server	1. Select the Web server that Retain uses.
	2. If you use IIS, click **Next** and skip to the next row.
	3. If you use Apache,
	    a. Browse to and select where it is installed.
	    b. Click **Next**.
	    c. If needed, adjust the AJP port.
	    d. Click **Next**.

Overwrite or Upgrade Retain	1. Leave the Upgrade option selected. 2. Click **Next**.
Ready to Install	1. Click the **Install** button. The installation process extracts and installs Retain 4.9.2. Then it starts the required system processes.
Information	The install reminds you to consult the documentation. 1. Wait a few moments to make sure all components have finished installing. 2. Click **Next**.
General Information	A message shows the Retain access URL. 1. Click **Next**.
Completing the Retain Setup Wizard	1. Click **Finish**. 2. Continue with "Updating the 4.9.2 Database Schema" on page 86

Updating the 4.9.2 Database Schema

Table 2-18   Completing the Upgrade to 4.9.2

Dialog/Section	Details
	1. In your administrative browser, open Retain's web admin console and log in as the Retain admin.

Dialog/Section	Details
Database Schema Enhanced	A message displays stating that the Configuration Database schema requires updating. 1. Click the **Enter Credentials** button. 2. Log in as the Retain admin user. Red text displays with a progress indicator. 3. When green text indicates that the schema is updated, restart the **Retain Tomcat** service. 4. Wait a few moments for Tomcat to restart, then refresh the browser.
Retain Login Dialog	1. Log in as the Retain admin user.

Moving Retain to a New Server

Moving Retain from Windows to Linux

The easiest method is to re-install everything to the new server and then copy over the archive and configuration files.

These instructions are for moving Retain and maintaining its current version.

Overview

To move Retain, you must move 3 things:

- **Configuration files.** Move the ASConfig.cfg, which is stored in a directory off of your Retain installation:

    Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/cfg

    Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg

    Indexer configuration files (the entire directory's contents):

    Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/solrweb/WEB-INF/cfg

    Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\solrweb\WEB-INF\cfg

- **Database.** Unless it's on a separate server from the Retain server and you are not wanting to move it.

- **Storage.** In summary, the storage directories to be copied are:
  - archive (required)
  - backup (optional, although we recommend you skip this since having it on the old server is backup enough until the next Retain maintenance performs a backup on he new server)
  - ebdb (optional)
  - export (optional)
  - index (required in Retain 4, recommended for Retain 3)
  - license (optional)
  - xml (optional)

NOTE: If you've added storage partitions in the Retain admin web interface, you must make sure all of those are copied correctly, too.

Preparation

1. Note where your Retain storage directory is located.

   To determine what that directory is, log into the RetainServer web interface and click on Server Configuration | Storage. The "Base Storage path" is your Retain storage directory (https://support.microfocus.com/kb/doc.php?id=7019531).

2. Download Retain to the new server and prepare it for the installation.

   a. Create the download directory.

      i. Make the directory for holding the software: md /software

      ii. Change to that directory: cd /software

   b. Download the latest version of Retain on the new server. For Retain 2.x customers, migrate your data to Retain 3.x format first; then proceed with moving Retain

   ---

   NOTE: You can use the wget command to download the software to the Linux server by changing into the software directory you created in step 2.a and running this command: wget '[url]'

   ---

      i. Get the URL of the most current version of Retain from https://download.gwava.com/download.php?product=Retain&version=current (https://download.gwava.com/download.php?product=Retain&version=current)

      ii. Now use that URL with the wget command on the Linux server inside the software directory you created.

         EXAMPLE: wget 'http://download.gwava.com/retain/Retain*version*.zip'

   c. Unzip the file and make the script files (.sh) executable.

      i. unzip [retain zip file] -d [retain zip filename, excluding the ".zip" at the end]

         Example: unzip Retain*version*.zip -d retain*version*

         The "-d" option causes it to create Note how we kept the "r" in lowercase follwing the "-d" option since Linux is case sensitive when changing directories.

      ii. chmod +x *.sh

3. Install Apache2 to the new server.

   a. Launch YaST | Software Management.

    b. In the search window, type: Apache2.

    c. Click on Apache2 (only), click on the Accept button, and accept the defaults.

4. (Optional) If you have edited the default properties files under the .../RetainWorker/WEB-INF/classes/config, back up those files and restore them after the final step of the move.

Moving Retain

1. Disable archive jobs and, if applicable, deletion jobs on the old server.

2. For good measure, shut down Tomcat (https://support.microfocus.com/kb/doc.php?id=7019531) on the old server.

3. Move the MySQL database if it resides on the Retain server; otherwise, proceed to step #4.

   See: "Moving MySQL Database to Another Server (https://support.microfocus.com/kb/doc.php?id=7019952)".

4. Install Retain on the new server.

    a. Change to your Retain software installation directory (i.e., /software/retain3510ga_262)

    b. Execute the installation script: ./RetainInstall.sh

    *****************************IMPORTANT***********************************

    At a certain point of the installation, you are presented the following prompt:

    Will MySQL be running on the same server as Retain?

    1) Yes

    2) No <---- Select this option even if MySQL is running on the same server

    Even if MySQL is running on the same server as Retain, type "2" for "No"; otherwise, it attempts to install and configure MySQL. At this point, you have already installed MySQL and moved your MySQL database to this new server, so selecting option 1 causes problems.

    *DO NOT log into the WEB UI at this point, you could damage the database data that you've just moved.

    c. Shut down Tomcat (https://support.microfocus.com/kb/doc.php?id=7019531) on the new server.

5. Copy the Retain storage directories from the old server to the new server (see step #1 under the "Preparation" section for the location of this directory). WARNING: This step can take days or weeks depending on the data size.

   Because the Windows server is using NTFS as the disk format and Linux something different (ext3, xfs, etc), you'll need to employ an approach where the data on these two distinct disk formats can be read from and written to by the same process.

   One approach is to create a CIFS mount from the Linux box to the Windows server. This requires that you first share the parent directory of the "archive" directory on your Windows server housing Retain. Another approach would be to install NFS services on the new Windows server, share the new storage directories, and mount from the old Linux server to the new shared storage directories.

   Once that is done, you can now use rsync to copy the files (https://support.microfocus.com/kb/doc.php?id=7019348) from Retain storage directory on Windows to the new Linux server. To help with this process, you may download and install Support's utility (https://support.microfocus.com/kb/doc.php?id=7019279) for copying the files/directories.

   Change to the new archive directory. It should have 256 subdirectories (00 - FF). All those subdirectories must have the ownership of tomcat tomcat.

```

└─────────────────────────────────────────────────────────────────────┘
```

Windows does not have a file ownership scheme similar to Linux, so once you've copied the storage directories over, you'll need to set the directory/file ownership and permissions. That process can take almost as much time as copying the directories did but it must be done in order for Retain to be able to read from and write to them. To do this, type: chown -R tomcat:tomcat [directory].

EXAMPLE: chown -R tomcat:tomcat archive (performed from the base storage path containing the archive, index, and other Retain storage directories)

6. Copy the configuration files from the old server to the new server and edit the paths referenced in those files to reflect their new locations:

   a. ASConfig.cfg, located in [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg.

   b. Edit the ASConfig.cfg and change several parameters to reflect the storage paths on the new server. Or, you can start tomcat, logon to the Retain Server web admin console, and change the paths under Server Configuration | Storage. If editing the ASConfig.cfg directly, look for these parameters for the storage paths:

      ◆ <basepath>

      ◆ <archivePath>

      ◆ <xmlPath>

      ◆ <indexPath>

      ◆ <backupPath>

      ◆ <licensePath>

      ◆ <EBDBPath>

      ◆ <exportPath>

c. RETAIN 4 ONLY:

    i. Edit the path the index directory to reflect its new location by opening the zoo.cfg file in ...\index\solrhome\

    ii. Copy everything from [drive]:\RetainServer\WEB-INF\solrweb\WEBINF\cfg.

7. Start Tomcat on the new server.

8. Login to the Retain Server web admin console.

9. Replace the existing Worker object. This is for systems where the Worker is on the Retain server or for situations where jobs won't start after moving Retain:

    a. Create a new worker web object using the instructions in "Installing and Configuring a Worker" in *Retain 4.9.2: Archiving Guide*.

    b. Download the bootstrap file.

    c. Edit all jobs assigned to the old worker and re-assign them to the new one.

    d. Delete the old worker object.

    e. Restart tomcat.

    f. From a web browser, go to the RetainWorker and upload the new bootstrap.

      http://[Retain server IP]/RetainWorker

10. If you backed up any of the Retain Worker properties files (see step #5 under the Preparation section), restore those to their respective directories. This does not apply to most customers - this is very rarely done.

Moving Retain from Linux to Windows

The easiest method is to re-install everything to the new server and then copy over the archive and configuration files.

These instructions are for moving Retain and maintaining its current version. If your current version of Retain is 2.x and you wish to upgrade afterwards (highly recommended), follow the instructions in the KB article, "Upgrade: Retain 2.x to Retain 3.5.1.1 (Windows)".

- "Overview" on page 91
- "Preparation" on page 92
- "Moving Retain" on page 92

Overview

To move Retain, you must move 3 things:

- **Configuration files.** Move the ASConfig.cfg, which is stored in a directory off of your Retain installation:

Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/cfg

Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg

Indexer configuration files (the entire directory's contents):

Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/solrweb/WEB-INF/cfg

Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\solrweb\WEB-INF\cfg

- **Database.** Unless it's on a separate server from the Retain server and you are not wanting to move it.

- **Storage.** In summary, the storage directories to be copied are:

  - archive (required)

  - backup (optional, although we recommend you skip this since having it on the old server is backup enough until the next Retain maintenance performs a backup on he new server)

  - ebdb (optional)

  - export (optional)

  - index (required in Retain 4, recommended for Retain 3)

  - license (optional)

  - xml (optional)

NOTE: If you've added storage partitions in the Retain admin web interface, you must make sure all of those are copied correctly, too.

Preparation

1. Note where your Retain storage directory is located. To determine what that directory is, log into the RetainServer web interface and click on Server Configuration | Storage. The "Base Storage path" is your Retain storage directory (https://support.microfocus.com/kb/doc.php?id=7020655).

2. Download Retain to the new server and prepare it for the installation.

   a. Prepare the download directory.

      We recommend creating a directory called Software on the root of the drive. It is not required and you may store the installation files wherever you desire, but if you do not have a strong preference, storing it at [drive]:\Software makes it easier to find later, especially for technical support.

   b. Download the latest version of Retain on the new server. For Retain 2.x customers, you'll first want to migrate your data to Retain 3.x format first; then proceed with moving Retain.

   c. Unzip the file, allowing Windows to create a new subdirectory off of "Software" with the same name as the zip file.

      For example, if the zip file were named, "Retain4031ga_48.zip", Windows - by default - creates a subdirectory called "Retain4031ga_48", so that the full path to the installation files becomes [drive]:\Software\Retain4031ga_48.

3. (Optional) Configure NFS Services (https://support.microfocus.com/kb/doc.php?id=7020834) on the new Windows server if you want to use Support's Retain Auxilliary Tool Set utility to copy your Retain storage to your new server.

4. Install/Configure IIS (https://support.microfocus.com/kb/doc.php?id=7020584) on the new server.

5. (Optional) If you have edited the default properties files under the Retain Worker directory(ies) (.../RetainWorker/classes/config) such as attachment.properties or errors.properties, you may want to back up those files to restore them after the final step of the move.

Moving Retain

1. Disable archive all archive jobs, and if applicable, deletion jobs on the old server.

2. For good measure, shut down Tomcat (https://support.microfocus.com/kb/doc.php?id=7019531) on the old server.

3. Move the database if it resides on the Retain server; otherwise, proceed to step #4. For customers using MySQL, reference "Moving MySQL Database to Another Server (https://support.microfocus.com/kb/doc.php?id=7019952)".

4. Copy the Retain storage directory from the old server to the new server (see step #1 under the "Preparation" section for the location of this directory).

WARNING: This step can take days or weeks depending on volume.

Because the Windows server is using NTFS as the disk format and Linux something different (ext3, xfs, etc), you'll need to employ an approach where the data on these two distinct disk formats can be read from and written to by the same process.

We recommend that you install NFS services on the new Windows server (https://support.microfocus.com/kb/doc.php?id=7020834), share the new storage directories, and mount from the old Linux server to the new shared storage directories.

Once that is done, you can now use rsync to copy the files from Retain storage directory on LInux to the new Windows server. To help with this process, you may download and install Support's utility for copying the archive directory.

5. Install Retain on the new server.

   *DO NOT log into the WEB UI at this point, you could damage the database data that you've just moved.

6. Shut down Tomcat on the new server.

7. Copy the configuration files from the old server to the new server and edit the paths referenced in those files to reflect their new locations:

   a. ASConfig.cfg, located in [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg.

   b. Edit the ASConfig.cfg and change several parameters to reflect the storage paths on the new server. Or, you can start tomcat, logon to the Retain Server web admin console, and change the paths under Server Configuration | Storage. If editing the ASConfig.cfg directly, look for these parameters for the storage paths:

      ◆ <basepath>
      ◆ <archivePath>
      ◆ <xmlPath>
      ◆ <indexPath>
      ◆ <backupPath>
      ◆ <licensePath>
      ◆ <EBDBPath>
      ◆ <exportPath>

   c. RETAIN 4 ONLY:

      i. Edit the path the index directory to reflect its new loation by opening the zoo.cfg file in ...\index\solrhome\

      ii. Copy everything from [drive]:\RetainServer\WEB-INF\solrweb\WEBINF\cfg.

8. Start Tomcat on the new server.

9. Login to the Retain Server web admin console.

10. Replace the existing Worker object. This is for systems where the Worker is on the Retain server or for situations where jobs won't start after moving Retain:

    a. Create a new worker object (https://support.microfocus.com/kb/doc.php?id=7020431).

    b. Download the bootstrap file.

    c. Edit all jobs assigned to the old worker and re-assign them to the new one.

    d. Delete the old worker object.

    e. Restart tomcat.

    f. From a web browser, go to the RetainWorker (http://[Retain server IP]/RetainWorker) and upload the new bootstrap.

11. If you backed up any of the Retain Worker properties files (see step #5 under the Preparation section), restore those to their respective directories. This does not apply to most customers - this is very rarely done.

Moving Retain To a Different Windows Server

The easiest method is to re-install everything to the new server and then copy over the archive and configuration files.

These instructions are for moving Retain and maintaining its current version. If your current version of Retain is 2.x and you wish to upgrade afterwards (highly recommended), follow the instructions in the KB article, "Upgrade: Retain 2.x to Retain 3.5.1.1 (Windows)".

Overview

To move Retain, you must move 3 things:

- **Configuration files.** Move the ASConfig.cfg, which is stored in a directory off of your Retain installation:

  Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/cfg

  Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg

  Indexer configuration files (the entire directory's contents):

  Linux default: /opt/beginfinite/retain/RetainServer/WEB-INF/solrweb/WEB-INF/cfg

  Windows default: [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\solrweb\WEB-INF\cfg

- **Database.** Unless it's on a separate server from the Retain server and you are not wanting to move it.

- **Storage.** In summary, the storage directories to be copied are:

  - archive (required)
  - backup (optional, although we recommend you skip this since having it on the old server is backup enough until the next Retain maintenance performs a backup on he new server)
  - ebdb (optional)
  - export (optional)

- index (required in Retain 4, recommended for Retain 3)
- license (optional)
- xml (optional)

NOTE: If you've added storage partitions in the Retain admin web interface, you must make sure all of those are copied correctly, too.

Preparation

1. Make a note of where your Retain storage directory is located. To determine what that directory is, log into the RetainServer web interface and click on Server Configuration | Storage. The "Base Storage path" is your Retain storage directory (https://support.microfocus.com/kb/doc.php?id=7020655).

2. Download Retain to the new server and prepare it for the installation.

   a. Prepare the download directory.

   We recommend creating a directory called Software on the root of the drive. It is not required and you may store the installation files wherever you desire, but if you do not have a strong preference, storing it at [drive]:\Software makes it easier to find later, especially for technical support.

   b. Download the latest version of Retain on the new server. For Retain 2.x customers, you'll first want to migrate your data to Retain 3.x format first; then proceed with moving Retain.

   c. Unzip the file, allowing Windows to create a new subdirectory off of "Software" with the same name as the zip file.

   For example, if the zip file were named, "Retain4031ga_48.zip", Windows - by default - creates a subdirectory called "Retain4031ga_48", so that the full path to the installation files becomes [drive]:\Software\Retain4031ga_48.

3. (Optional) Configure NFS Services (https://support.microfocus.com/kb/doc.php?id=7020834) on the new Windows server if you want to use Support's Retain Auxilliary Tool Set utility to copy your Retain storage to your new server.

4. Install/Configure IIS (https://support.microfocus.com/kb/doc.php?id=7020584) on the new server.

5. (Optional) If you have edited the default properties files under the Retain Worker directory(ies) (.../RetainWorker/classes/config) such as attachment.properties or errors.properties, you may want to back up those files to restore them after the final step of the move.

Moving Retain

1. Disable archive all archive jobs, and if applicable, deletion jobs on the old server.

2. For good measure, shut down Tomcat (https://support.microfocus.com/kb/doc.php?id=7019531) on the old server.

3. Move the database if it resides on the Retain server; otherwise, proceed to step #4. For customers using MySQL, reference "Moving MySQL Database to Another Server (https://support.microfocus.com/kb/doc.php?id=7019952)".

4. Install Retain on the new server. *DO NOT log into the WEB UI at this point, you could damage the database data that you've just moved.

5. Shut down Tomcat on the new server.

6. Copy the Retain storage directory from the old server to the new server (see step #1 under the "Preparation" section). Robocopy (http://social.technet.microsoft.com/wiki/contents/articles/1073.robocopy-and-a-few-examples.aspx)is Microsoft's tool for this kind job. Make sure to include empty directories. Verbose logging is recommended.

WARNING: This step can take days or weeks depending on volume.

---

7. Copy the configuration files from the old server to the new server and edit the paths referenced in those files to reflect their new locations:

    a. ASConfig.cfg, located in [drive]:\Program Files\Beginfinite\Retain\RetainServer\WEB-INF\cfg.

    b. Edit the ASConfig.cfg and change several parameters to reflect the storage paths on the new server. Or, you can start tomcat, logon to the Retain Server web admin console, and change the paths under Server Configuration | Storage. If editing the ASConfig.cfg directly, look for these parameters for the storage paths:

        ◆ <basepath>

        ◆ <archivePath>

        ◆ <xmlPath>

        ◆ <indexPath>

        ◆ <backupPath>

        ◆ <licensePath>

        ◆ <EBDBPath>

        ◆ <exportPath>

    c. RETAIN 4 ONLY:

    a. Edit the path the index directory to reflect its new loation by opening the zoo.cfg file in ...\index\solrhome\

    b. Copy everything from [drive]:\RetainServer\WEB-INF\solrweb\WEBINF\cfg.

8. Start Tomcat on the new server.

9. Login to the Retain Server web admin console.

10. Replace the existing Worker object. This is for systems where the Worker is on the Retain server or for situations where jobs won't start after moving Retain:

    a. Create a new worker web object. See "Installing and Configuring a Worker" in *Retain 4.9.2: Archiving Guide*.

    b. Download the bootstrap file.

    c. Edit all jobs assigned to the old worker and re-assign them to the new one.

    d. Delete the old worker object.

    e. Restart tomcat.

    f. From a web browser, go to the RetainWorker (http://[Retain server IP]/RetainWorker) and upload the new bootstrap.

11. If you backed up any of the Retain Worker properties files (see step #5 under the Preparation section), restore those to their respective directories. This does not apply to most customers - this is very rarely done.

Moving Retain To a Different Linux Server

The easiest method is to re-install everything to the new server and then copy over the archive and configuration files.

These instructions are for moving Retain and maintaining its current version. If your current version of Retain is 2.x and you wish to upgrade afterwards (highly recommended), follow the instructions in the KB article, "Upgrade: Retain 2.x to Retain 3.x (Windows)".

Overview

In order to move Retain there are 3 things that are not optional that MUST be moved.

1. The ASConfig.cfg
2. The Database (unless it's on a separate server in which case it can stay there. That part is up to you.)
3. The archive files. It is recommended that you also copy the indexes. It would be more work not to and would be disruptive to searching.

   Everything else can be re-created but can also be copied if you wish. In summary, here are the storage directories to be copied:

    - archive (required)
    - index (recommended)
    - backup (optional)
    - ebdb (optional)
    - export (optional)
    - license (optional)
    - xml (optional)
4. For Retain 4 only:
    - .../index/solrhome/zoo.cfg
    - .../RetainServer/WEB-INF/solrweb/WEB-INF/cfg

NOTE: If you've added storage partitions in the Retain admin web interface, you must make sure all of those are copied correctly, too.

Preparation

1. Make a note of where your Retain storage directory is located.

   To determine what that directory is, log into the RetainServer web interface and click on Server Configuration | Storage. The "Base Storage path" is your Retain storage directory (http://https://support.microfocus.com/kb/doc.php?id=7020655).

2. Download Retain to the new server and prepare it for the installation.

    a. Create the download directory.

        ◆ Make the directory for holding the software: md /software

        ◆ Change to that directory: cd /software

    b. Download the major Retain version you are currently using into the software directory you created on the new server.

        If Retain 2.x, download that version. It could be a newer build of that same major version. What you want to avoid is downloading Retain 2.x when your old system is Retain 1.x or downloading Retain 3.x when your old system is Retain 2.x.

        Download the same major version of Retain that your are currently using, going with the latest build of that major version (where "major version" is 2.x, 3.x, 4.x, etc):

        http://download.gwava.com/download.php?product=Retain&version=versions (http://download.gwava.com/download.php?product=Retain&version=versions)

        NOTE: You can use the wget command to download the software to the Linux server by changing into the software directory you created in step 2.a and running this command: wget '[url]'

        EXAMPLE: wget 'http://download.gwava.com/retain/Retain3511ga_53.zip'

    c. Unzip the file and make the script files (.sh) executable.

        i. unzip [retain zip file] -d [retain zip filename, excluding the ".zip" at the end]

            Example: unzip Retain3511ga_53.zip -d retain3511ga_53

            The "-d" option causes it to create Note how we kept the "r" in lowercase follwing the "-d" option since Linux is case sensitive when changing directories.

        ii. chmod +x *.sh

3. Install Apache2 to the new server.

    a. Launch YaST | Software Management.

    b. In the search window, type: Apache2.

    c. Click on Apache2 (only), click on the Accept button, and accept the defaults.

4. (Optional) If you have edited the default properties files under the .../RetainWorker/WEB-INF/classes/config, you may want to back up those files to restore them after the final step of the move. However, you could always access them from the original Retain server if needed.

"Making the Move"

1. Disable all archive and deletion jobs on the old server.

2. For good measure, stop Tomcat (http://https://support.microfocus.com/kb/doc.php?id=7019531) on the old server.

3. Move the MySQL database if it resides on the Retain server. See: "Moving MySQL Database to Another Server (http://https://support.microfocus.com/kb/doc.php?id=7019952)".

4. Install Retain on the new server.

    a. Change to your Retain software installation directory (i.e., /software/retain3510ga_262)

    b. Execute the installation script: ./RetainInstall.sh

        ******************************IMPORTANT**********************************

        At a certain point of the installation, you are presented the following prompt:

        Will MySQL be running on the same server as Retain?

1) Yes

2) No <---- Select this option even if MySQL is running on the same server

Even if MySQL is running on the same server as Retain, type "2" for "No"; otherwise, it attempts to install and configure MySQL. At this point, you have already installed MySQL and moved your MySQL database to this new server, so selecting option 1 causes problems.

*DO NOT log into the WEB UI at this point, you could damage the database data that you've just moved. Now is probably the best time to Stop Retain.

5. Copy your storage directory contents from the existing server to the new server.

NOTE: This step is made easy by a Linux utility created by GWAVA Support for this very purpose called Retain Auxiliary Tool Set (http://support.microfocus.com/kb/doc.php?id=7019279) (affectionately referred to as "RATS").

If you wish to manually do this (ok, so you like to do it the hard way), here are the steps:

a. Connect the existing server's storage directory to the new server; or, rsync supports addressing the DNS hostname or IP address of the destination server if you wish to do it that way.

   If you decide to mount the new server's storage directory, one way to do this is to create an "export" of the existing server's storage directory and create an NFS mount to a drive from the new server over to the exported drive on the existing server. For sample instructions on how to create an export and how to mount to it, see "How to 'Map' (Mount) Another Server's Linux Directory to Your Server (https://support.microfocus.com/kb/doc.php?id=7020700)".

b. Change the tomcat userid on the new server to match the tomcat userid on the old server (if necessary).

   File ownership and permissions are tied to a userid, not a user name; thus, if tomcat on server A has a userid assignment of 110 and tomcat on new server B has 107, then the files that get copied over come over as being owned by userid 110, not "tomcat". As the files get stored on server B, it looks up userid 110 on its system. If that ID is assigned to another process, say "Puppet", then the files are owned by that program, not tomcat. So, you must check what the tomcat userid is on source server A and and on destination server B and make them match by changing the userid, if necessary, on destination server B.

   i. On the old server, type: cat /etc/passwd

      This lists all the user accounts on the server, showing their userids and group IDs. In the list in the screenshot, tomcat is listed last and its userid is 110 and its group ID is 1000.

```
ldap:x:76:70:User for OpenLDAP:/var/lib/ldap:/bin/bash
lp:x:4:7:Printing daemon:/var/spool/lpd:/bin/bash
mail:x:8:12:Mailer daemon:/var/spool/clientmqueue:/bin/false

wwwrun:x:30:8:WWW daemon apache:/var/lib/wwwrun:/bin/false
mysql:x:109:114:MySQL server:/var/lib/mysql:/bin/bash
tomcat:x:110:1000::/home/tomcat:/sbin/nologin
+:::::::
retain3:~ #
```

ii. Do this same procedure on the new server.

If the userids match for tomcat on both servers, consider yourself fortunate and you are ready for the next step "c"; otherwise, proceed to sub-step "3)".

iii. Look at the new server's userid list you obtained.

Determine whether another process on the new server is using the same userid assigned to Tomcat on the old server.

If so, you'll need to change that processes' userid to an unused userid by following the same steps outlined in the following sub-step "4)" for Tomcat's userid change. Then, follow sub-step "4)" to change Tomcat's userid.

iv. Change a userid by typing this command: usermod -u [new userid assignment] [username getting the new userid]

```
ldap:x:76:70:User for OpenLDAP:/var/lib/ldap:/bin/bash
lp:x:4:7:Printing daemon:/var/spool/lpd:/bin/bash
mail:x:8:12:Mailer daemon:/var/spool/clientmqueue:/bin/false

/bin/bash
uucp:x:10:14:Unix-to-Unix CoPy system:/etc/uucp:/bin/bash
uuidd:x:102:104:User for uuidd:/var/run/uuidd:/bin/false
wwwrun:x:30:8:WWW daemon apache:/var/lib/wwwrun:/bin/false
mysql:x:109:114:MySQL server:/var/lib/mysql:/bin/bash
tomcat:x:110:1000::/home/tomcat:/sbin/nologin
+::::::
retain3:~ # usermod -u 103 tomcat
```

You can also use vi to edit /etc/passwd and manually change the userids; whichever is easier for you.

c. Change to the main Retain storage directory and copy it from the old server to the new server.

We recommend using rsync. Regardless, when copying files on Linux, be sure that whatever method you use copies over the permissions and ownerships.

NOTE: This should carry over the tomcat ownership and proper file permissions; however, if they are not preserved during the copy process for some reason, you need to set them:

---

chown –R tomcat:tomcat [full path to new storage directory]

chmod –R 744 [full path to new storage directory]

This could take days or weeks to complete since the storage's archive directory contains over 16M subdirectories; thus, it is much better if the permissions/ownership are preserved during the copy process.

6. Shut down Tomcat on the new server if you haven't already.

7. Copy Retain configuration file(s):

Again, copy in such a way that you maintain its file permissions and ownership (tomcat:tomcat); otherwise, remember to set the file ownership and permissions afterwards..

a. Copy the /opt/beginfinite/retain/RetainServer/WEB-INF/cfg/ASConfig.cfg

---

NOTE: If the storage directory on the new server is different from the old server, you must open ASConfig.cfg and change several parameters to reflect the storage paths on the new server:

- ◆ <basepath>
- ◆ <archivePath>
- ◆ <xmlPath>
- ◆ <indexPath>

- ◆ <backupPath>
- ◆ <licensePath>
- ◆ <EBDBPath>
- ◆ <exportPath>
  b. If this is a Retain 4 system:
    i. Copy the .../index/solrhome/zoo.cfg and edit the path the index directory if it has changed.
    ii. Copy everything from .../RetainServer/WEB-INF/solrweb/WEBINF/cfg.
8. Start Tomcat on the new server.
9. Login to the RetainServer web interface.
10. For systems where the Worker is on the Retain server, create a new worker object in the RetainServer web interface to replace the old one:
    a. Create a new worker (https://support.microfocus.com/kb/doc.php?id=7020431).
    b. Download the bootstrap file.
    c. Edit all jobs assigned to the old worker and re-assign them to the new one.
    d. Delete the old worker.
    e. Restart tomcat.
    f. From a web browser, go to the RetainWorker (http://[Retain server IP]/RetainWorker) and upload the new bootstrap
11. If you backed up any of the RetainWorker properties files (see step #4 under the Preparation section), restore those to their respective directories. This does not apply to most customers - this is very rarely done.

Moving a MySQL Database to Another Server

The steps for moving a MySQL database are provided as a courtesy and are not officially supported by Micro Focus. ; however, we do provide consulting services that can perform this for you. Contact your local sales representative if interested.

Linux or Windows to Windows

1. Disable all archive and deletion jobs and - for good measure, stop Tomcat on the Retain server.
2. Perform a dump of the database (https://dev.mysql.com/doc/refman/5.5/en/mysqldump.html).
3. Download MySQL onto the new server.
4. Install MySQL and configure the retain database on the new server.

   Refer to the appendix of the Windows Install Guide for instructions. At this point, you may want to configure MySQL memory allocation in the [drive]:\Program Files\MySQL\MySQL Server 5.x\my.ini file. Your retain database uses the innoDB storage engine. The following should be researched and considered (reference our KB, "MySQL Database maintenance for Best Performance"):

```
innodb_buffer_pool_size
innodb_innodb_additional_mem_pool_size
innodb_log_file_size
innodb_log_buffer_size
```

This can enhance the performance of MySQL and Retain. The MySQL for Windows installer configures settings for you based on your system's available memory and the answers to the questions you provide its configuration wizard, so there may not be anything you need to do; however, you might want to research this and play with those settings to find what works best for your system. GWAVA support cannot answer questions about or help customer's with their databases. That is the customer's responsibility.

If you decide to change the innodb_log_file_size setting, you must take the following preparatory steps before doing so:

   a. Open the MySQL Command Line Client (Start | Programs | MySQL)

   b. Log into MySQL: mysql -u root -p

   c. From the MySQL prompt, type: SET GLOBAL innodb_fast_shutdown=0; Then type "quit" to log out of MySQL.

   d. Stop the MySQL service.

   e. Rename the ib_logfile0 and ib_logfile1 files.

   f. Edit the C:\Program Files\MySQL\MySQL Server 5.x\my.ini and change the innodb_log_file_size setting and save the file.

   g. Start the MySQL service.

If you do not take these steps when changing the logfile size, MySQL doesn't load. You can re-enable the innodb_fast_shutdown (...=1) afterwards if there is a need, but average size systems do not seem to experience any significant delay in MySQL shutdowns by leaving it disabled.

5. Import the dump into the new retain database.

   a. Open the MySQL Command Line Client (Start | Programs | MySQL)b) Type: mysql -u root -p retain < [path to dump file]\[dump filename]

       EX: mysql -u root -p retain < d:\dump\2013-12-11.sql NOTE: This assumes that the ..\MySQL\bin directory is in the path.

6. (Optional) Reboot the server to clear memory.8. Start Tomcat and re-enable archive jobs; and, if used, re-enable deletion jobs. 9. If only moving MySQL and not Retain; and, if using IP addresses and not DNS names (or using a new DNS address), change Retain's URL to the MySQL server in the ASConfig.cfg:

   a. Edit the ASConfig.cfg (/opt/beginfinite/retain/RetainServer/WEB-INF/cfg) 2) Change the <DBURL> and <confDBURL> settings to reflect the the new IP/DNS address 3) Save the changes 4) Restart Tomcat on the Retain server.

Linux to Linux

1. Disable all archive and deletion jobs and stop Tomcat on the Retain server.

2. Perform a dump of the database.

3. Download MySQL onto the new server and un-tar it. Retain only needs the client and the server RPM's, but it is simpler to download one bundle file then two separate files.

4. Install MySQL and configure the retain database on the new server.

    At this point, you may want to configure MySQL memory allocation in the /etc/my.cnf file. Your retain database uses the innoDB storage engine. The following should be researched and considered:

```
innodb_buffer_pool_size
innodb_innodb_additional_mem_pool_size
innodb_log_file_size
innodb_log_buffer_size
```

If done correctly, this can enhance the performance of MySQL and Retain. You might want to research this and experiment with those settings to find what works best for your system. GWAVA support cannot answer questions about or help customer's with their databases. That is the customer's responsibility.

If you decide to change the innodb_log_file_size setting, you must take the following steps first:

    a. Log into MySQL: mysql -u root -p

    b. From the MySQL prompt, type: SET GLOBAL innodb_fast_shutdown=0;

       Then type "quit" to log out of MySQL.

    c. Shut down MySQL: rcmysql stop

    d. Rename the ib_logfile0 and ib_logfile1 files.

    e. Edit the /etc/my.cnf and change the logfile size.

    f. Start up MySQL: rcmysql start

       If you do not take these steps when changing the logfile size, MySQL doesn't load. You can re-enable the innodb_fast_shutdown (...=1) afterwards if there is a need, but average size systems do not seem to experience any significant delay in MySQL shutdowns by leaving fast shutdowns disabled.

5. Import the dump into the new retain database.

   mysql -u root -p retain < /[path to dump file]/[dump filename] To watch the progress of the import, use this command: watch "mysqladmin -u root -p[mysql root user pw] processlist"

6. (Optional) Reboot the server to clear the memory. 7. Start up Tomcat and re-enable archive jobs; and if used, re-enable deletion jobs.

Upgrading MySQL to a New Version

-
-

Upgrading MySQL on Linux

Upgrading and existing MySQL on a Retain server.

1. Stop Tomcat on the Retain server. See

2. Perform a dump (https://dev.mysql.com/doc/refman/5.5/en/mysqldump.html) of the database.

3. Download MySQL onto the server on which you wish to install MySQL and un-tar it. Retain only needs the client and the server RPM's, but it is simpler to download one bundle file then two separate files.

4. Stop MySQL: rcmysql stop

5. Uninstall MySQL if upgrading to the same server; otherwise, skip to step #8.

    a. Check YaST | Software Management first for MySQL. Uninstall it from there if applicable.

       If it has a "lock" icon, it cannot be uninstalled from Software Management. Proceed to step "b".

    b. Check for any other MySQL RPMs.

rpm -qa | grep -i mysql

Sample screen output:

```
gwlinux:/ # rpm -qa | grep -i mysql
libmysqlclient_r15-5.0.96-0.6.1
MySQL-server-community-5.1.72-1.sles11
MySQL-client-community-5.1.72-1.sles11
libmysqlclient15-5.0.96-0.6.1
libqt4-sql-mysql-4.6.3-5.25.4
```

  c. Uninstall all instances of MySQL found in step b (if any) - but only the entries beginning with "MySQL..."

  rpm -e [current mysql rpm]

  Based on the screenshot shown above in in sub-step "b", I would type:

  rpm -e MySQL-server-community-5.1.72-1.sles11

  This has to be done for each RPM discovered.

6. Delete or rename the entire "datadir" directory.

  This is the mysql directory containing the ibdata1 database and the "retain" subdirectory. It is no longer needed since you have already dumped the database. All of the files and subdirectories are recreated without any loss of data as long as you have a good/current dump.

  The "datdir" directory is specified in the /etc/my.cnf. Look for the "[mysqld]" section. The first line reads, "datdir=[path]"

  If not specified in the my.cnf, the datadir could be at /var/lib/mysql. This is the default datadir directory if MySQL is installed manually.

7. Rename /etc/my.cnf to my.cnf.old.

8. Install MySQL and configure the retain database.

9. Import the dump into the new retain database.

  mysql -u root -p retain < /[path to dump file]/[dump filename]

  To watch the progress of the import, use this command: watch "mysqladmin -u root -p[mysql root user pw] processlist"

10. Reboot the server to clear the memory; otherwise, start up Tomcat and you are done.

Upgrading MySQL on Windows

Upgrading MySQL

1. Stop Tomcat on the Retain server. See "Starting and Stopping the Retain Server" on page 50.

2. Perform a dump (https://dev.mysql.com/doc/refman/5.5/en/mysqldump.html) of the database.

3. Download MySQL onto the server on which you want to install it.

4. Install MySQL and configure the retain database. Refer to the appendix of the Windows Install Guide for instructions.

5. Import the dump into the new retain database.

  a. Open a command window (cmd).

  b. Change directories to: C:\Program Files\MySQL\MySQL Server 5.0\bin (the beginning of the path depends upon where MySQL was installed).

  c. Type: mysql -u root -p retain < [path to dump file]\[dump filename]

EX: mysql -u root -p retain < d:\dump\2013-12-11.sql

NOTE: This assumes that the `..\MySQL\bin` directory is in the path.

6. (Optional) Reboot the server to clear memory; otherwise, just start Tomcat.
