About This Guide

This ZENworks 11 Primary Server and Satellite Reference provides information about managing ZENworks Primary Servers and configuring devices to function as Satellites. The guide includes the following sections:

- Part I, “ZENworks Server,” on page 9
- Part II, “Satellites,” on page 33
- Part III, “Server Hierarchy,” on page 75
- Part IV, “Content,” on page 83
- Appendix A, “Support for L4 Switches,” on page 117
- Appendix B, “Schedule Types,” on page 119
- Appendix C, “Understanding Communication between ZENworks Components in Multi-Locale Environment,” on page 125
- Appendix D, “RPMs for Linux Primary Servers,” on page 127
- Appendix E, “Documentation Updates,” on page 133

Audience

This guide is intended for ZENworks administrators.

Feedback

We want to hear your comments and suggestions about this manual and the other documentation included with this product. Please use the User Comments feature at the bottom of each page of the online documentation.

Additional Documentation

ZENworks 11 is supported by other documentation (in both PDF and HTML formats) that you can use to learn about and implement the product. For additional documentation, see the ZENworks 11 documentation Web site (http://www.novell.com/documentation/zenworks11).
## Contents

About This Guide 3

Part I ZENworks Server 9

1 ZENworks Services on a Windows Server 11
   1.1 Checking the Status of a ZENworks Service 12
   1.2 Starting the ZENworks Services 12
   1.3 Stopping the ZENworks Services 13
   1.4 Restarting the ZENworks Services 13

2 ZENworks Services on a Linux Server 15
   2.1 Checking the Status of a ZENworks Service 16
   2.2 Starting the ZENworks Services 16
   2.3 Stopping the ZENworks Services 16
   2.4 Restarting the ZENworks Services 17

3 Configuring Additional Access to a ZENworks Server 19
   3.1 Addressing Non-Detectable IP Address Conditions 19
   3.2 Addressing Non-Detectable DNS Name Conditions 19

4 Configuring Restricted Access to a ZENworks Server 21

5 Determining the ZENworks Software Version Installed on Servers 23

6 Uninstalling a ZENworks Server 25

7 Deleting a ZENworks Primary Server 27

8 ZENworks Server Reports 29

9 Troubleshooting ZENworks Server 31

Part II Satellites 33

10 Understanding the Satellite Roles 35
   10.1 Understanding the Authentication Role 35
   10.2 Understanding the Collection Role 35
   10.3 Understanding the Content Role 36
   10.4 Understanding the Imaging Role 36
11 Adding and Configuring Satellite Devices
11.1 Tasks for Adding and Configuring Satellites .................................................. 39
11.2 Authentication Role ............................................................................................. 43
  11.2.1 Prerequisites to Configure the Authentication Role on a Satellite ................. 43
  11.2.2 Configuring the Authentication Role on a Satellite .................................... 43
11.3 Collection Role ..................................................................................................... 44
11.4 Content Role ......................................................................................................... 45
11.5 Imaging Role ......................................................................................................... 46
11.6 Satellite Server Output Throttle Rate Calculations ........................................... 48

12 Refreshing a Satellite

13 Removing the Roles from a Satellite

14 Removing Satellites from the Server Hierarchy

15 Specifying Content to be Hosted

16 Manually Replicating Content from a Primary Server to Satellite Devices

17 Moving a Satellite from One Primary Server to Another Primary Server

18 Specifying a Different Repository for the Content Role Satellite (Windows Only)

19 Specifying a Different Repository for Content Role Satellite (Linux Only)

20 Promoting an RHEL 6 device as a Content or Collection Role Satellite

21 Promoting a Macintosh Device to Be a Content Role Satellite Server

22 Promoting a Macintosh Device to Be a Collection Role Satellite Server

23 Troubleshooting Satellites

Part III Server Hierarchy

24 Primary Servers: Peer Versus Parent/Child Relationships

25 Satellite Role Relationships
  25.1 Authentication Role Server Relationships ......................................................... 79
  25.2 Content Role Server Relationships ................................................................. 79
  25.3 Collection Role Server Relationships ............................................................. 79
  25.4 Imaging Role Server Relationships ................................................................. 79

26 Changing the Parent-Child Relationships of Primary Servers
  26.1 Making a Primary Server a Child ................................................................. 81
# Contents

26.2 Making a Primary Server a Peer ................................................................. 81

## Part IV Content

27 Replicated Content ................................................................................. 85

### 28 Content Repository

28.1 Changing the Location of the Content Repository on a Windows Server ........................................... 87
28.2 Changing the Location of the Content Repository on a Linux Server ................................................. 89
   28.2.1 Mounting a Share ......................................................................................... 89
   28.2.2 Unmounting a Share .................................................................................... 90
   28.2.3 Creating a Permanent Mount. ...................................................................... 90
   28.2.4 Moving Existing Content to the New Repository ........................................... 90
28.3 Mounting the Content Repository on a Linux Server to an NSS Volume ................................. 90
28.4 Changing the Location of the Temporary Location on a Windows Server ............................. 91
28.5 Changing the Location of the Temporary Location on a Linux Server .............................. 93
   28.5.1 Mounting a Share ......................................................................................... 93
   28.5.2 Unmounting a Share .................................................................................... 93
   28.5.3 Creating a Permanent Mount. ...................................................................... 94

### 29 Content Replication

29.1 Configuring Content Replication at the Management Zone Level ........................................... 96
   29.1.1 Manually Configuring the Web Service Timeout Advanced Content Replication Setting ................................................................................. 97
29.2 Replicating Content to New Content Servers ........................................................................... 97
29.3 Manually Replicating Content from a Primary Server to Satellite Devices ............................. 98
29.4 Including or Excluding Content ...................................................................................... 98
   29.4.1 Managing a Single Piece of Content on Multiple Content Servers .................. 99
   29.4.2 Managing Content on the Folder Level ....................................................... 99
   29.4.3 Managing Multiple Pieces of Content on a Single Content Server .......... 100
   29.4.4 Managing Multiple Pieces of Content on Multiple Content Servers ........ 100
29.5 Replicating Content to Primary Servers .............................................................................. 101
29.6 Cleaning up Content from the Primary Server ..................................................................... 101

### 30 Content Delivery

30.1 Setting Up Location Closest Server Rules ........................................................................ 103
30.2 Scheduling Delivery Blackout Dates ............................................................................... 103
30.3 Setting the Device Refresh Schedule .............................................................................. 104

### 31 Content Sharing

31.1 Sharing the content-repo Directory on the Primary Server ........................................... 107
   31.1.1 Sharing the Content Repository on a SUSE Linux ....................................... 107
   31.1.2 Sharing the Content Repository on Windows ............................................ 109
31.2 Sharing the content-repo Directory on a Satellite Server ............................................. 110
31.3 Configuring the Settings on a Managed Device .................................................................. 111

### 32 Troubleshooting

A Support for L4 Switches ............................................................................. 117
   A.1 Predeployment Tasks ...................................................................................... 118
B  Schedule Types  119
B.1  Date Specific  .............................................................. 119
B.2  Event  ....................................................................... 120
B.3  Now  ......................................................................... 121
B.4  Recurring  ................................................................. 121

C  Understanding Communication between ZENworks Components in Multi-Locale Environment  125

D  RPMs for Linux Primary Servers  127

E  Documentation Updates  133
E.1  March 2013: Update for ZENworks 11 SP2 (11.2.3)  ........................................ 133
The ZENworks Server is the backbone of the ZENworks system. It communicates with the ZENworks Adaptive Agent on managed devices to perform management tasks. It stores content to be delivered to devices and images to be used for imaging devices. It communicates with other ZENworks Servers and ZENworks Satellites to replicate or receive content, software and hardware inventory, and messages throughout the Management Zone.

The following sections provide additional information about the ZENworks Server:

- Chapter 1, “ZENworks Services on a Windows Server,” on page 11
- Chapter 2, “ZENworks Services on a Linux Server,” on page 15
- Chapter 3, “Configuring Additional Access to a ZENworks Server,” on page 19
- Chapter 4, “Configuring Restricted Access to a ZENworks Server,” on page 21
- Chapter 5, “Determining the ZENworks Software Version Installed on Servers,” on page 23
- Chapter 6, “Uninstalling a ZENworks Server,” on page 25
- Chapter 7, “Deleting a ZENworks Primary Server,” on page 27
- Chapter 8, “ZENworks Server Reports,” on page 29
- Chapter 9, “Troubleshooting ZENworks Server,” on page 31
When it is running on a Windows server, a ZENworks Server includes the services listed in the following table. All services are always installed regardless of the ZENworks 11 products (Asset Management, Configuration Management, Endpoint Security Management, Patch Management and Full Disk Encryption) you have licensed and activated. If a service is not required for your product, it is disabled.

<table>
<thead>
<tr>
<th>Service</th>
<th>Service Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy DHCP Service</td>
<td>novell-proxydhcp</td>
<td>Used with a standard DHCP server to inform PXE-enabled devices of the IP address of the Novell TFTP server.</td>
</tr>
<tr>
<td>TFTP Service</td>
<td>novell-tftp</td>
<td>Used by PXE-enabled devices to request files that are needed to perform imaging tasks.</td>
</tr>
<tr>
<td>ZENworks Datastore</td>
<td>dbsrv12</td>
<td>Embedded database used for storing ZENworks objects and resources.</td>
</tr>
<tr>
<td>ZENworks Endpoint Security Service</td>
<td>zesservice</td>
<td>Used to support location awareness in the ZENworks Agent.</td>
</tr>
<tr>
<td>ZENworks Loader</td>
<td>zenloader</td>
<td>Used for loading and controlling the Java services that perform ZENworks Server tasks.</td>
</tr>
<tr>
<td>ZENworks Preboot Policy Service</td>
<td>novell-zmgprebootpolicy</td>
<td>Used by PXE-enabled devices to check for assigned preboot policies and work.</td>
</tr>
<tr>
<td>ZENworks Preboot Service</td>
<td>novell-pbserv</td>
<td>Used to provide imaging services to a device. This includes sending and receiving image files, discovering assigned Preboot bundles, acting as session master for multicast imaging, and so forth.</td>
</tr>
<tr>
<td>ZENworks Remote Management</td>
<td>nزرwinvnc</td>
<td>Used to enable remote management of the server.</td>
</tr>
<tr>
<td>ZENworks Server</td>
<td>zenserver</td>
<td>Used for communicating with the ZENworks Agent.</td>
</tr>
<tr>
<td>ZENworks Services Monitor</td>
<td>zenwatch</td>
<td>Used to monitor the status of the ZENworks services.</td>
</tr>
</tbody>
</table>
The services reside in the \novell\zenworks\bin directory on a ZENworks Server. Refer to the following sections for instructions to help you control the ZENworks services:

- Section 1.1, “Checking the Status of a ZENworks Service,” on page 12
- Section 1.2, “Starting the ZENworks Services,” on page 12
- Section 1.3, “Stopping the ZENworks Services,” on page 13
- Section 1.4, “Restarting the ZENworks Services,” on page 13

### 1.1 Checking the Status of a ZENworks Service

1. On the server, click Start, select Administrative Tools > Services, then review the status of the services listed in Table 1-1 on page 11.

### 1.2 Starting the ZENworks Services

Do one of the following:

- Start the ZENworks services from the Services windows:
  1. Click the desktop Start menu.
  2. Click Settings > Control Panel.
  4. Select the service you want to start (see Table 1-1 on page 11), then click Start.
- Start the ZENworks services from the command prompt:
  1. Execute the following command:
     novell-zenworks-configure -c Start
     By default, all the services and the Start option are selected.
  2. To start a specific service, specify the number next to the service, then press Enter.
     or
     To start all the services, press Enter.

The ZENworks services start when the ZENworks Server is booted and should not normally need to be restarted. If you need to frequently restart the services, ensure that your server hardware meets the ZENworks minimum requirements. If the server does not have adequate RAM, ZENworks services might not continue running. For more information, see “Primary Server Requirements” in the ZENworks 11 Server Installation Guide.
1.3 **Stopping the ZENworks Services**

Do one of the following:

- Stop the ZENworks services from the Services windows:
  1. Click the desktop *Start* menu.
  2. Click *Settings > Control Panel*.
  3. Double-click *Administrative Tools > Services*.
  4. Select the service you want to stop (see Table 1-1 on page 11), then click *Stop*.

- Stop the ZENworks services from the command prompt:
  1. Execute the following command:
     
     ```
     novell-zenworks-configure -c Stop
     ```
  2. To stop a specific service, specify the number next to the service you want to stop followed by the number next to the *Stop* action by using comma (,) as the delimiter, then press Enter.
  or
  To stop all the services, specify the number next to the *Stop* action, then press Enter.

1.4 **Restarting the ZENworks Services**

Do one of the following:

- Restart the ZENworks services from the Services windows:
  1. Click the desktop *Start* menu.
  2. Click *Settings > Control Panel*.
  3. Double-click *Administrative Tools > Services*.
  4. Select the service you want to restart (see Table 1-1 on page 11), then click *Restart*.

- Restart the ZENworks services from the command prompt:
  1. Execute the following command:
     
     ```
     novell-zenworks-configure -c Start
     ```
  2. To restart a specific service, specify the number next to the service you want to restart followed by the number next to the *Restart* action by using comma (,) as the delimiter, then press Enter.
  or
  To start all the services, specify the number next to the *Restart* action, then press Enter.
When it is running on a Linux server, the ZENworks Server includes the services listed in the following table. All services are always installed regardless of the ZENworks 11 products (Configuration Management, Asset Management, Endpoint Security Management, and Patch Management) you have licensed and activated. If a service is not required for your product, it is disabled.

Table 2-1  ZENworks Services on Linux

<table>
<thead>
<tr>

<td>ZENworks Server</td>
<td>novell-zenserver</td>
<td>Used for communicating with the ZENworks Adaptive Agent.</td>
</tr>
<tr>
<td>ZENworks Services Monitor</td>
<td>novell-zenmtr</td>
<td>Used to monitor the status of the ZENworks services.</td>
</tr>
<tr>
<td>ZENworks Imaging Agent</td>
<td>novell-zislnx</td>
<td>Used to save and restore image-safe data on the server (as a managed device).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Only runs when launched by the ZENworks Adaptive Agent.</td>
</tr>
</tbody>
</table>
The services reside in the `/etc/init.d` directory. Refer to the following sections for instructions to help you control the ZENworks services:

- Section 2.1, “Checking the Status of a ZENworks Service,” on page 16
- Section 2.2, “Starting the ZENworks Services,” on page 16
- Section 2.3, “Stopping the ZENworks Services,” on page 16
- Section 2.4, “Restarting the ZENworks Services,” on page 17

### 2.1 Checking the Status of a ZENworks Service

At the console prompt, enter the following command:

```
/etc/init.d/servicename status
```

Replace `servicename` with the name of the service as listed in Table 2-1 on page 15.

### 2.2 Starting the ZENworks Services

- To start a ZENworks service, do one of the following:
  - Enter the following command at the console prompt:
    
    ```
    /etc/init.d/servicename start
    
    Replace `servicename` with the name of the service as listed in Table 2-1 on page 15.
    
    - At the console prompt, execute `/opt/novell/zenworks/bin/novell-zenworks-configure -c Start`, specify the number next to the service you want to start, then press Enter.
  
  - To start all the ZENworks services:
    1. Execute the following command at the server prompt:
      
      ```
      /opt/novell/zenworks/bin/novell-zenworks-configure -c Start
      
      By default, all the services and the `Start` option are selected.
      
      2. Press Enter.
    
    The ZENworks services start when the ZENworks Server is booted and should not normally need to be restarted. If you need to frequently restart the services, ensure that your server hardware meets the minimum ZENworks requirements. If the server does not have adequate RAM, ZENworks services might not continue running. For more information, see “Primary Server Requirements” in the ZENworks 11 Server Installation Guide.

### 2.3 Stopping the ZENworks Services

- To stop a service, do one of the following:
  - Enter the following command at the console prompt:
    
    ```
    /etc/init.d/servicename stop
    
    Replace `servicename` with the name of the service as listed in Table 2-1 on page 15.
    
    - At the console prompt, execute `/opt/novell/zenworks/bin/novell-zenworks-configure -c Start`, specify the number next to the service you want to stop, then press Enter.
To stop all the ZENworks services:
1. Execute the following command at the server prompt:
   
   `/opt/novell/zenworks/bin/novell-zenworks-configure -c Start`
2. Enter the number next to the Stop action.

### 2.4 Restarting the ZENworks Services

To restart a service that is already running, do one of the following:

- Enter the following command at the console prompt:
  
  `/etc/init.d/servicename restart`

  Replace servicename with the name of the service as listed in Table 2-1 on page 15.

- At the console prompt, execute `/opt/novell/zenworks/bin/novell-zenworks-configure -c Start`, specify the number next to the service you want to restart, then press Enter.

To restart all the ZENworks services:

1. Execute the following command at the server prompt:
   
   `/opt/novell/zenworks/bin/novell-zenworks-configure -c Start`
2. Enter the number next to the Restart action.
3 Configuring Additional Access to a ZENworks Server

If you have managed devices that are unable to authenticate to the IP address or DNS name of a ZENworks Server, such as devices outside the firewall or devices using a proxy server, you can specify additional IP addresses or DNS names for the ZENworks Server that can be used by the devices for access to the server.

- Section 3.1, “Addressing Non-Detectable IP Address Conditions,” on page 19
- Section 3.2, “Addressing Non-Detectable DNS Name Conditions,” on page 19

### 3.1 Addressing Non-Detectable IP Address Conditions

The Non-Detectable IP Addresses panel lets you specify the addresses that can be used to access the ZENworks Server when the server’s IP address cannot be found by a device.

1. In ZENworks Control Center, click Devices in the left pane, select Servers in the Devices panel, select a server object, click the Settings tab, click Infrastructure Management, then select Non-detectable IP Addresses.
2. Fill in the field:
   - **IP Address:** Standard dotted-decimal notation. For example, `192.168.0.1`.
3. Click Add to add the address to the list.
4. Repeat Step 1 to Step 3 to add additional IP addresses.
5. If necessary, use the Move Up and Move Down buttons to reorder the list.
   - The IP addresses are used in the order listed, from top to bottom.
6. When you are finished adding addresses, click Apply or OK to save the addresses.

### 3.2 Addressing Non-Detectable DNS Name Conditions

The Additional DNS Names panel lets you specify additional names that can be used to access the ZENworks Server when the server’s DNS name cannot be found by a device.

The DNS names added in this panel are distributed to all managed devices for them to use in connecting to the server.

To add a DNS name:

1. In ZENworks Control Center, click Devices in the left pane, select Servers in the Devices panel, select a server object, click the Settings tab, click Infrastructure Management, then select Additional DNS Names.
2. In the List of Server DNS Names field, specify the DNS name for the IP address of the server (such as a proxy server) that the devices can access.
3 Click *Add* to add the DNS name to the list.

4 If necessary, use the *Move Up* and *Move Down* buttons to reorder the list.
   The DNS names are used in the order listed, from top to bottom.

5 When you are finished adding addresses, click *Apply* or *OK* to save the addresses.
You can configure a list of IP addresses for the ZENworks server that should not be visible to the registration agent:

To restrict an IP addresses:

1. In ZENworks Control Center, click Devices in the left pane, select Servers in the Devices panel, select a server object, click the Settings tab, click Infrastructure Management, then select Restricted IP Addresses.

2. Click the address in the Visible IP Addresses list, then click > to move that IP address to the Restricted IP Addresses list.

To make a restricted IP address visible to the registration agent:

1. In ZENworks Control Center, click Devices in the left pane, select Servers in the Devices panel, select a server object, click the Settings tab, click Infrastructure Management, then select Restricted IP Addresses.

2. Click the address in the Restricted IP Addresses list, then click < to move that IP address to the Visible IP Addresses list.
Determining the ZENworks Software Version Installed on Servers

For upgrading and troubleshooting purposes, you use ZENworks Control Center to determine which versions of ZENworks Configuration Management (ZCM), ZENworks Asset Management (ZAM), ZENworks Patch Management (ZPM), ZENworks Endpoint Security Management (ZESM) and ZENworks Full Disk Encryption (FDE) are running on ZENworks Primary Servers in your Management Zone.

To see ZENworks version information for a specific Primary Server in your Management Zone:

1. In ZENworks Control Center, click the Devices tab.
2. Click Servers, then click the desired Primary Server.
4. (Optional) Click the underlined version number next to ZENworks Configuration Management Version to see a list of installed packages.

To see ZENworks version information for all Primary Servers in your Management Zone:

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy panel, view the version information in the ZCM Version, ZAM Version, ZPM Version, ZESM Version and FDE Version columns for each server.
Instructions for uninstalling a ZENworks Server are provided in “Uninstalling ZENworks Software” in the ZENworks 11 Server Installation Guide.
Deleting a ZENworks Primary Server

If you cannot run the uninstallation program to uninstall a ZENworks Primary Server, you can delete it from the Server Hierarchy panel.

WARNING: Use extreme caution when deleting a ZENworks Primary Server from your ZENworks system.

Deleting a ZENworks Primary Server is irreversible. The preferred way to decommission a Primary Server is to run the uninstallation program from the Server. Deleting a Primary Server should only be used if the uninstallation program cannot be run (for example, if the Primary Server experiences a hard drive failure). For more information about running the uninstallation program, see “Uninstalling ZENworks Software” in the ZENworks 11 Server Installation Guide.

If you remove a Primary Server that hosts an internal ZENworks Sybase database, your entire ZENworks Management Zone becomes inoperable.

If you remove a Primary Server on which the Patch Management subscription service is configured to run, you must reset the Patch Management settings before deleting the server. For more information on how to reset the Patch Management settings, see “Viewing Subscription Service Information” in the ZENworks 11 SP2 Patch Management Reference.

Deleting a ZENworks Server completely removes the ZENworks Server from the Management Zone. There is no recovery.

You can delete managed server and workstation devices by using the options on the Devices tab, as explained in “Deleting Devices from Your ZENworks System” in the ZENworks 11 Discovery, Deployment, and Retirement Reference.

To remove a ZENworks Primary Server from your Management Zone:

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy section, select the check box next to the Primary Server (you can select multiple devices).
3. Click Action > Delete ZENworks Server.
You must have installed ZENworks Reporting Server to view the predefined reports. For more information on how to install ZENworks Reporting Server, see the ZENworks 11 Server Installation Guide.

To view a predefined report for the ZENworks Server:

1. In ZENworks Control Center, click the Reports tab.
2. In the ZENworks Reporting Server panel, click ZENworks Reporting Server InfoView to launch the ZENworks Reporting Server InfoView.
3. Navigate to the Novell ZENworks Reports folder > Predefined Reports > ZENworks System folder.

The following predefined report is included for the ZENworks Server:

**ZENworks Server Statistics:** Displays server statistics such as database, disk space, CPU usage, and various connection details that include total connections per day and average connections per day.

For more information on creating and managing reports, see the ZENworks 11 System Reporting Reference documentation.
Troubleshooting ZENworks Server

- “The casa_atsd service on a Linux server fails to start” on page 31
- “Unable to start the ZENworks Services on a Windows Primary Server” on page 31

The casa_atsd service on a Linux server fails to start

Source: ZENworks 11; ZENworks Server
Explanation: On a Linux server, if you choose to manually start the casa_atsd service that is in the unused state, the service fails to start.
Action: If the casaatsd.pid file exists within the /var/lib/CASA/authToken/svc/ directory, delete the file and then restart the service.

Unable to start the ZENworks Services on a Windows Primary Server

Source: ZENworks 11; ZENworks Server
Explanation: After you reboot or restart a Windows Primary Server, the ZENworks Services fail to start. If you choose to manually start the services, the following error message is displayed: Error 1609: The service did not start due to a logon failure.
Possible Cause: A group policy setting, applied on the server, has revoked the log on as a service right for the specified user account.

NOTE: Most of the ZENworks Services run as a privileged user account. This account can be identified based on the following naming convention: _z_x_y__, where x and y are the last two digits of the IP address of the server, added at the time of installation.

Action 1 (Mandatory): Configure the applied group policy setting to add the user account to the list of accounts that possess the log on as a service right.
Action 2 (Optional): If the ZENworks Services do not start after performing Action 1, perform the following steps:

1. Start the Local Security Settings MMC snap-in.
2. Expand Local Policies, and then click User Rights Assignment.
3. In the right pane, right-click Log on as a service, and then click Security.
4. Add the user to the policy, and then click OK.
5. Close the Local Security Settings MMC snap-in.
Satellites

A Satellite is a managed device that can perform some of the roles that a ZENworks Primary Server normally performs, including authentication, information collection, content distribution, and imaging. A Satellite can be any managed Windows or Linux device (server or workstation), but not a Primary Server. For more information, see “System Requirements” in the ZENworks 11 Server Installation Guide and “Deploying the ZENworks Adaptive Agent” in the ZENworks 11 Discovery, Deployment, and Retirement Reference.

When you configure a Satellite, you specify which roles it performs (Authentication, Collection, Content, or Imaging). A Satellite can also perform roles that might be added by third-party products that are snap-ins to the ZENworks 11 framework.

You might, for example, create a Satellite in a location across a slow WAN link and create Closest Server rules to offload one or more roles from the Primary Server to the newly created Satellite to improve the performance of your ZENworks system.

NOTE: For information about Satellites from the perspective of an end user using the ZENworks Adaptive Agent, see “Satellite Roles” in the Novell Adaptive Agent Guide.

The following sections contain more information:

- Chapter 10, “Understanding the Satellite Roles,” on page 35
- Chapter 11, “Adding and Configuring Satellite Devices,” on page 39
- Chapter 12, “Refreshing a Satellite,” on page 51
- Chapter 13, “Removing the Roles from a Satellite,” on page 53
- Chapter 14, “Removing Satellites from the Server Hierarchy,” on page 55
- Chapter 15, “Specifying Content to be Hosted,” on page 57
- Chapter 16, “Manually Replicating Content from a Primary Server to Satellite Devices,” on page 59
- Chapter 17, “Moving a Satellite from One Primary Server to Another Primary Server,” on page 61
- Chapter 18, “Specifying a Different Repository for the Content Role Satellite (Windows Only),” on page 63
- Chapter 19, “Specifying a Different Repository for Content Role Satellite (Linux Only),” on page 65
- Chapter 20, “Promoting an RHEL 6 device as a Content or Collection Role Satellite,” on page 67
- Chapter 21, “Promoting a Macintosh Device to Be a Content Role Satellite Server,” on page 69
- Chapter 22, “Promoting a Macintosh Device to Be a Collection Role Satellite Server,” on page 71
- Chapter 23, “Troubleshooting Satellites,” on page 73
A Satellite is a device that can perform some of the roles that a ZENworks Primary Server normally performs, including authentication, information collection, content distribution, and imaging. The following sections contain more information about each role:

- Section 10.1, “Understanding the Authentication Role,” on page 35
- Section 10.2, “Understanding the Collection Role,” on page 35
- Section 10.3, “Understanding the Content Role,” on page 36
- Section 10.4, “Understanding the Imaging Role,” on page 36

10.1 Understanding the Authentication Role

When users logged in to previous versions of ZENworks, they were authenticated to the Management Zone by contacting the ZENworks Primary Server, which in turn contacted the user source that contains the users.

Satellite devices with the Authentication role can now speed the authentication process by spreading the workload among various devices and by performing authentication locally to managed devices. You can have multiple Satellite devices with the Authentication role. In addition, each Satellite with the Authentication role can have multiple user sources configured and each Satellite can have multiple connections to each user source to provide failover.

When a managed device uses a Satellite for authentication, the Satellite issues an authentication token to the managed device so that it can authenticate to the Management Zone using SSL.

On the managed device, the Authentication module is inactive until you promote the managed device to be a Satellite with the Authentication role or until the Authentication role is added to an existing Satellite.

NOTE

- If a Satellite device performing the Authentication role is a member of a domain, all managed devices authenticating to that Satellite must be members of the same domain.
- ZENworks Agent can authenticate through a Satellite Server only if at least one Primary Server is reachable. If none of the Primary Servers are reachable and only the Satellite Server is reachable, the agent falls back to do the cache login.

10.2 Understanding the Collection Role

If you want to improve information roll-up access for a group of devices to minimize traffic to the ZENworks Primary Server that is hosting the ZENworks database, you can enable the Collection role on a device. For example, if you have devices that are rolling up information to a Primary Server outside of their network segment, you can minimize network traffic by enabling the Collection role.
on a device within the network segment to accept the information from the other devices in that segment. That Collection role device is then the only device from that segment that is rolling up information to the Primary Server.

You can enable the Collection role on any managed device. The Collection role requires only the Collection role module that is installed with the ZENworks Adaptive Agent. The module is inactive until you enable the Collection role on the managed device.

When you enable a Collection role on a device, you can assign any ZENworks Primary Server as its parent server. The Collection role device uploads information only to its parent Primary Server. If the parent Primary Server is not a child of another Primary Server, it writes the information directly to the database. If the parent Primary Server is a child of another Primary Server, it passes the information up to its parent Primary Server, which writes the information to the database.

A Satellite with the Collection role collects inventory information, messages (errors, warning, informational, and so forth), and policy and bundle statuses, then rolls that information up to its parent Primary Server, which does the database writing. The role includes a roll-up schedule that you can edit.

On the managed device, the Collection module is inactive until you promote the managed device to be a Satellite with the Collection role or until the Collection role is added to an existing Satellite.

### 10.3 Understanding the Content Role

Content consists of bundles, policies, system updates (ZENworks Server and Adaptive Agent), and patches.

If you want to improve content access for a group of devices without creating another Primary Server, you can create the Content role on a device. For example, if you have devices that are accessing a Primary Server outside of their network segment, you can create the Content role on a device within the network segment to service those devices.

The Content role provides the same content delivery service as a Primary Server but requires only the Content role module that is installed with the ZENworks Adaptive Agent. The module is inactive until you enable it on the managed device.

When you enable the Content role on a device, you assign a Primary Server as its parent content server. The Content role Satellite downloads content only from its parent Primary Server. Therefore, any content you want hosted on a Content role Satellite must also be hosted on its parent Primary Server.

On the managed device, the Content module is inactive until you promote the managed device to be a Satellite with the Content role or until the Content role is added to an existing Satellite.

### 10.4 Understanding the Imaging Role

The Imaging role installs the Imaging services and adds the Imaging role to the device. With this role, the device can be used as an Imaging server to perform all Imaging operations, such as taking an image and applying an image within or across subnets by using unicast or multicast imaging.

The Imaging role can be used to achieve load balancing for the Primary Server, and also to support cross-subnet imaging. The Satellite uses ZENworks Control Center to communicate with the Primary Server for Imaging operations in the Auto mode.
On the managed device, the Imaging module is inactive until you promote the managed device to be a Satellite with the Imaging role or until the Imaging role is added to an existing Satellite. This activates the Imaging services on the device, and enables you to perform the Imaging operations in auto and maintenance mode. The Imaging services installed on the device include TFTP, Preboot policy, pbserv, and proxy DHCP. All services, except for proxy DHCP, are automatically started. You can manually start or stop the proxy DHCP service from ZENworks Control Center.
You can create a new Satellite device or configure an existing Satellite with the Authentication, Content, Imaging, and Collection roles, change its default port, and adjust the schedules for the roles. You can also remove roles from an existing Satellite.

Before promoting a managed device as a Satellite, ensure to review the following guidelines:

- The ZENworks version installed on the managed device must be the same as that of the Primary Server.

**NOTE**

Ensure that you update the Satellite Server to the latest version of ZENworks before you promote to any role.

- You cannot promote the following devices as a Satellite:
  - A managed device that has a previous version of ZENworks Adaptive Agent (version 10.x, 11.0, or 11.1,) installed.
  - A ZENworks 11.x test device.

- You cannot change the Satellite roles and settings for the existing Satellites until you upgrade the Satellites to ZENworks 11. For more information on how to upgrade Satellites to ZENworks 11, see “Upgrading Satellites and Managed Devices to ZENworks 11” in the ZENworks 11 Upgrade Guide.

- For a MAC device that has been promoted as a Satellite, only the Collection and Content roles are available.

The following sections contain more information:

- **Section 11.1, “Tasks for Adding and Configuring Satellites,” on page 39**
- **Section 11.2, “Authentication Role,” on page 43**
- **Section 11.3, “Collection Role,” on page 44**
- **Section 11.4, “Content Role,” on page 45**
- **Section 11.5, “Imaging Role,” on page 46**
- **Section 11.6, “Satellite Server Output Throttle Rate Calculations,” on page 48**

### 11.1 Tasks for Adding and Configuring Satellites

1. To add a new Satellite into the Server Hierarchy panel, in ZENworks Control Center, click the **Configuration** tab. In the Server Hierarchy panel, select the check box next to the desired Primary Server, click **Action**, then click **Add Satellite Server**.

   or
To configure an existing Satellite from the Server Hierarchy panel, in ZENworks Control Center, click the **Configuration** tab. In the Server Hierarchy panel, select the check box next to the Satellite that you want to configure, click **Action**, then click **Configure Satellite Server**.

You can only configure one Satellite at a time.

or

To configure an existing Satellite from the device view, in ZENworks Control Center, click the **Devices** tab, then on the **Managed** tab, click either **Servers** or **Workstations**. In the Servers or Workstations panel, select the check box for the Satellite that you want to configure, click **Action**, then click **Configure Satellite Server**.

You can only configure one Satellite at a time.

Depending on whether you are adding a new Satellite device or configuring an existing device, the title of the dialog box is different (Add Satellite Server or Configure Satellite Server). The settings and options on each page are similar.

You can also use the `zman satellite-server-create (ssc)` command to add or configure roles for a Satellite. For more information, see “Satellite Commands” in the ZENworks 11 Command Line Utilities Reference.

2 Click the **General** tab to specify the basic information about the satellite server, including the roles of the server. (Conditional) To remove Satellite roles from a device, deselect the desired role in the Satellite Server Roles section, then click **OK**.

3 (Conditional) To add a role to a Satellite, select the desired role in the Satellite Server Roles section.
If the Configure link is disabled for any role, that role is disabled for this device. For example, if the Satellite’s parent Primary Server does not have the Collection role, the Satellite’s Collection role is disabled and cannot be configured. Non-configurable roles that a managed device performs are also listed in the dialog box but cannot be edited.

See the following sections for more information about each role:

- Section 11.2, “Authentication Role,” on page 43
- Section 11.3, “Collection Role,” on page 44
- Section 11.4, “Content Role,” on page 45
- Section 11.5, “Imaging Role,” on page 46

4. Click the Server Settings tab to view the default port and throttle rate settings. You can change these default values if required.

5. Click the Content Replication tab to select one of the listed content replication methods.

**Port for Content and/or Collection HTTP Requests:** In this field specify the port number (Optional). The default port is 80. Content and Collection servers share the same Web server and the same port. Make sure that the specified port is not in use.

**Port for authentication Secure HTTPS requests:** In this field, specify the port number. The default port is 443. This is the port on which the Satellite device listens while communicating with the managed devices. Make sure that the specified port is not in use.

**Satellite Server Output Throttle Rate (in kbps):** In this field, specify the rate at which the Satellite server should send the content to other devices requesting the content. These devices could be either other content satellite servers or managed devices.

Satellite server calculates different throttle rates in the following scenarios:
- A Single content request with the Content type throttle
- A Single content request without the Content type throttle
- Multiple requests without the Content type throttle
- Multiple requests with the Content type throttle

For more information, see “Satellite Server Output Throttle Rate Calculations” on page 48.
A satellite with the Content role replicates content from other satellite content servers by using one of the following methods:

**Use Parent Primary Server Only**: This is the default content replication method. The satellite replicates content only from its parent primary server (as configured during the satellite promotion).

**Use Closest Content Servers First**: Select this option if you want the Satellite server to look for a content repository hosted in the CIFS location (if it is configured) or closest content servers first, to replicate the content.

If the CIFS location is not configured or if content is not found in the CIFS location, the Satellite Server checks the closest content servers for content replication before trying to use the parent Primary Server.

The CIFS share or the closest servers will be determined by the Location or the Network environment that is effective on the Satellite.

**Use Closest Content Servers Only**: Select this option if you want the Satellite Server to look for a content repository hosted in the CIFS location (if it is configured) or closest content servers only to replicate the content. If the CIFS location is not configured or if content is not found in the CIFS location, the Satellite Server checks the closest content servers for content replication. If content is not found on the closest servers as well, the replication will fail.

The CIFS share or the closest servers will be determined by the Location or the Network environment that is effective on the Satellite.

6 Click **OK** to save your changes and exit the dialog box.

7 Repeat the previous steps to configure other Satellites.

8 Specify the devices that need to use this Satellite for the Collection Roll-Up, Content, Authentication and Imaging roles.

9 To configure the Location Closest Server for this Satellite:
   9a On the **Configuration** page, click the **Locations** tab.
   9b In the **Locations** panel, click the location for which you want to configure the Closest Servers rules.
   9c Click the **Servers** tab.
   9d Configure the location closest servers.
11.2 **Authentication Role**

This role helps speed the authentication process by spreading the workload among various devices and by performing authentication locally to managed devices.

- Section 11.2.1, “Prerequisites to Configure the Authentication Role on a Satellite,” on page 43
- Section 11.2.2, “Configuring the Authentication Role on a Satellite,” on page 43

11.2.1 **Prerequisites to Configure the Authentication Role on a Satellite**

If you have installed ZENworks 11 with external certificates, you must complete the following tasks on the Satellite before configuring the Authentication role on a Satellite:

1. Ensure that the Satellite has its own individual server certificate and private key.
   
   For detailed information on how to create to an external certificate, see “Creating an External Certificate” in the [ZENworks 11 Server Installation Guide](#).

2. Import the external certificate by using the `zac iac` command.
   
   For more information about zac, view the `zac man page` (man zac) on the Satellite or see the [ZENworks 11 Command Line Utilities Reference](#).

   **NOTE:** You must import the external certificate each time you promote the Satellite to Authentication role.

11.2.2 **Configuring the Authentication Role on a Satellite**

1. (Optional) To configure the Authentication role on a Satellite, select the check box next to `Authentication`, click `Configure` to display the Configure Authentication dialog box.

2. Specify the authentication port.

3. Select a user source from the User Source drop-down list.

4. Click `Add` to display the Add User Source Connections dialog box.

   Fill in the fields:

   - **Connection Name:** (Optional) Specify all or part of the name for the connection to the LDAP directory, then click `Filter` to display the list of connections that match the criteria.

   If you have many connections in your ZENworks Management Zone, you can use the `Connection Name` field to display only those connections that match the criteria. For example, to display all connections that contain the word “London,” type `London` in the `Connection Name` field, then click `Filter`.

   - **Connection Address:** (Optional) Specify part of the IP address or DNS hostname of the connection to the LDAP directory, then click `Filter` to display all connections with that IP address.

   If you have many connections in your ZENworks Management Zone, you can use the `Connection Address` field to display only those connections that match the criteria. For example, to search for and display all connections that have an IP address starting with 172, type `172` in the `Connection Address` field, then click `Filter`.

   - **User Source Connections:** Select the check box next to the connection you want to add.

5. Click `OK` to return to the Configure Authentication dialog box.

6. (Optional) Reorder the connections in the User Source Connection list by selecting a connection’s check box, then clicking `Move Up` or `Move Down`. 

---

**Adding and Configuring Satellite Devices** 43
The device uses the connections in the order they are listed to authenticate the device to the ZENworks Management Zone.

7 Click OK to return to the Add Satellite Server or Configure Satellite Server dialog box.

8 Continue with Step 4 on page 41.

NOTE

Any change made to an Authentication satellite server in the Zone will trigger a device refresh through the Quick Task feature. If the Authentication satellite is modified, it will cause all the Authentication satellite servers in the Zone to refresh. This may lead to the creation of excessive Quick Tasks, resulting in the clogging of database.

To prevent the creation of excessive Quick Tasks, you can configure the Quick Task refresh interval by editing the quicktask_trigger_interval field in the file named quicktask.properties. This file can be accessed from the following location:

- **On Windows:** ZENworks_installation_path\novell\zenworks\conf\quicktask
- **On Linux:** /etc/opt/novell/zenworks/conf

By default, the Quick Task refresh interval value is set as 600 minutes (10 hours). If changes are made to the satellite server within the predefined refresh interval, a new Quick Task will not be created. The new changes will get reflected on the managed devices when the next system refresh is performed.

### 11.3 Collection Role

This role causes the device to collect inventory information, messages (errors, warning, informational, and so forth), and policy and bundle statuses, then rolls that information up to its parent Primary Server, which in turn either writes to the database directly or passes the information to its parent Primary Server, which does the database writing.

1 Select the check box next to **Collection**, then click **Configure**.

2 Fill in the field:

   **Collection Roll-Up Schedule:** Specify the number of days, hours, and minutes for how often you want the collected data to be rolled up from the devices that use it as a collection server.

   The Collection Roll-Up schedule determines how often the collected inventory information is rolled up to the parent Primary Server for inclusion in the ZENworks database. When the information is in the database, it is viewable in ZENworks Control Center.

3 Click OK.

4 Continue with Step 4 on page 41.
11.4 Content Role

This role enables the managed device to distribute content (bundles, policies, system updates, and patches) to other devices.

When you set up a device to function with a Content role, you must specify a Primary Server as its parent. The device with the Content role receives all content from its parent Primary Server. Any content you want hosted on a Satellite with the Content role must also be hosted on its parent Primary Server. If the content is not hosted on the new Primary Server, it is added.

1 Select the check box next to Content, click Configure, then click Add.

Fill in the fields:

**Content Type**: Select a Content Type (for example, Policy, Non-Patch Bundles, or System Update Server).

**NOTE**: If you choose Imaging as the Content Type and configure the settings to replicate the Imaging content, these settings are automatically reflected in the Configure Imaging Content Replication dialog box invoked while configuring the Imaging role to the device. Similarly, the Imaging content replication settings configured while configuring the Imaging role to a device are automatically reflected in the Configure Content Type Replication dialog box invoked while configuring the Content role with the Imaging content type to the device.

**Throttle (in KB/sec)**: Select the throttle rate. This rate specifies the maximum rate at which content (in kilobytes per second) is replicated. The actual rate can be lower, depending on other factors, including the number of downloads.

**NOTE**: The specified throttle speed only controls the rate at which ZENworks delivers content, it does not control the rate at which the NIC sends data to other applications. Thus the total bandwidth used by the server’s NIC may be greater than the throttle speed set.

To view the traffic from ZENworks alone, you need to filter on the ports configured for your server. For example 80 and 443.

**Duration**: Click the up-arrow or down-arrow to set the content update duration period in minutes. Depending on the Schedule Type and its options you select, you need to be aware of the following:

- The End Time setting in all three scheduling types (Days of the Week, Month, and Fixed Interval) is not the true end time when the content update stops processing. The end time specifies the end of the time period during which an update can start.

  If you select Days of the Week or Month and set a random start and end time, the update starts between these times and continues for the specified duration. For example, if the Duration is set at the default of 60 minutes and the update starts 10 minutes before the specified end time, content is updated for the entire 60 minutes. The same concept applies for the Fixed Interval schedule. If Duration is set at the default of 60 minutes and the end time does not allow enough time for the specified duration, content is updated for the entire 60 minutes.

- If the Primary Server contains too much content to update during the specified duration, the update continues at the next regularly scheduled time. Content that already exists on the Satellite device is not updated again. Content that was not updated during the previous update and any new content added to the Primary Server is updated.
Schedule Type: Select a schedule for how often you want the Satellite's content to be updated from the parent Primary Server:

- **No Schedule**: If you select *No Schedule*, content is never automatically updated from the parent Primary Server. To manually replicate the content run the `zac wake-cdp (cdp)` command on the Satellite.

- **Recurring**: Select *Days of the Week, Monthly, or Fixed Interval*, then fill in the fields. For more information, see Section B.4, “Recurring,” on page 121.

You should also consider the following:

- We recommend you to set the schedule to 12 hours.
- When you change the default Zone level Content Replication Schedule, the new schedule is not applied to the existing Satellite Servers that have been promoted to the Content role. For the new Content Replication Schedule to be applied to the promoted Satellite Servers, you can either demote and then promote the Satellite Servers to the Content role or you can edit the default Content Replication Schedule for each promoted Satellite Server.

Be aware that the cleanup action for content occurs every night at midnight.

If you do not set a schedule for a particular type of content, the `<Default>` schedule applies to all content of that type.

2. Click OK twice to return to the Add Satellite Server or Configure Satellite Server dialog box.

3. Continue with Step 4 on page 41.

4. (Optional) Specify the content to host on the Content Server. For more information, see Section 29.4, “Including or Excluding Content,” on page 98.

   If you want to specify the content that the Satellite hosts, you can include or exclude content from being replicated to it.

   If you want to include content that its parent Primary Server does not have, you must first add the content to the parent Primary Server.

11.5 Imaging Role

Selecting this option installs the Imaging services and adds the Imaging role to the device. With this role, the device can be used as an Imaging server to perform all the Imaging operations, such as taking an image, applying an image, and multicasting an image. However, the ZENworks images are not replicated from the Primary Server to Imaging Satellites.

**NOTE:** The Imaging role is tied to the state of your ZENworks Configuration Management license. If your license state is deactivated, the Imaging role is disabled. For example, if you have a licensed copy of ZENworks Asset Management and you are evaluating ZENworks Configuration Management, the Imaging role is disabled if your ZENworks Configuration Management license expires. For more information, see “Possible License State Changes” in the ZENworks 11 Product Licensing Reference.

1. Select the check box next to Imaging, then click Configure.

2. (Conditional) Select the check box next to **Enable PXE Services** to automatically start the Proxy DHCP service on the device to which the Imaging Server role has been assigned.

   To check whether the Proxy DHCP service has been started on the device, review the message log of the device (`Devices` tab > `Workstations` folder > click the workstation > `Summary` > `Message Log panel`).
3 (Conditional) Select the check box next to Delete Image Files from the Server if Imaging Role is Removed if you want the ZENworks image files to be automatically deleted from the device when the Imaging role is removed from the device.

The messages are logged in the Message Log panel if the severity level of the local file and the system log is set to Information and Above on the Local Device Logging page. (Configuration tab > Device Management > Local Device Logging).

This option is available only when you want to remove the Imaging Server role from the device.

4 Click Options next to Configure Imaging Content Replication to launch the Configure Imaging Content Replication dialog box.

The Configure Imaging Content dialog box lists a default configuration that applies to the imaging content, with a fixed interval schedule of every five minutes, no throttling, and a 60-minute content replication period.

5 Configure the Imaging content replication settings.

5a Select a throttle rate (in KB/sec). This rate specifies the maximum rate at which content (in kilobytes per second) is replicated. The actual rate can be lower, depending on other factors, including the number of downloads.

5b Select the duration of the content replication.

When you set the duration, be aware of the following:

- The End Time setting in all three scheduling options in the Recurring schedule type (Days of the Week, Month, and Fixed Interval) is not the end time when the content stops replicating. The start and end time settings specify the time period during which a replication can start.

  If you select Days of the Week or Month and set a random start and end time, the replication starts between these times and continues for the specified duration. For example, if the Duration is set at the default of 60 minutes and replication starts 10 minutes before the specified end time, content is replicated for the entire 60 minutes. The same concept applies for the Fixed Interval schedule. If Duration is set at the default of 60 minutes and the end time does not allow enough time for the specified duration, content is replicated for the entire 60 minutes.

- If the Primary Server contains too much content to replicate during the specified duration, the replication continues at the next regularly scheduled time. Content that already exists on the Satellite device is not replicated again. Content that was not replicated during the previous replication session and any new content added to the Primary Server is replicated.

5c Select a schedule (No Schedule or Recurring).

The Imaging Content Replication schedule determines how often the imaging content is sent down from the parent Primary Server to its child Satellite. Be aware that the cleanup action for content occurs every night at midnight.

If you do not set a schedule, the <Default> schedule applies to the Imaging content.

5d Click OK to save the changes.

NOTE: You can also configure the Imaging content replication settings while configuring the Content role to a device. These settings are automatically reflected in the Configure Imaging Content Replication dialog box invoked while configuring the Imaging role to the device. Similarly, the Imaging content replication settings configured while configuring the Imaging role to a device are automatically reflected in the Configure Content Type Replication dialog box invoked while configuring the Content role with Imaging content type to the device.

6 Click OK.
7 (Conditional) If you configure the Imaging role, the role is immediately added to the device. If the role is not immediately added, it is added only during the next device refresh schedule. If you want to immediately apply the role to the device, manually refresh the device in one of the following ways:

- In the ZENworks Control Center, click the Configuration tab > the Server Hierarchy, select the check box next to the devices you want to refresh, then click Action > Refresh Device.
- On a managed device, do one of the following:
  - Right-click the icon, then click Refresh.
  - Execute the zac ref command from the console prompt.

To check whether the Proxy DHCP service has been started on the device, review the message log of the device (Devices tab > Workstations folder > click the workstation > Summary > Message Log panel or Devices tab > Servers folder > click the server > Summary > Message Log panel).

The messages are logged in the Message Log panel only if the severity level of the local file and the system log is set to Information and Above on the Local Device Logging page. (Configuration tab > Device Management > Local Device Logging).

8 (Conditional) If the Linux Satellite has the Imaging role configured, turn off the firewall on the device before performing imaging operations.

11.6 Satellite Server Output Throttle Rate Calculations

When you assign the Content role to a Satellite Server, you need to specify the output throttle rate for it. The Satellite server output throttle rate is the rate at which the Satellite Server should send the content to other devices requesting content. These devices could be either other content Satellite Servers or managed devices.

While sending content to other devices, the Satellite Server calculates the throttle rate in the following manner:

**For a Single Content Request with a Content Type Throttle:** If you specified the Satellite Server output throttle rate as 500, and if the content type throttle is set to 200, then the final throttle rate will be smaller of the two.

**For a Single Content Request with No Content Type Throttle:** If you specified the Satellite Server output throttle rate as 500, and if there is no content type throttle configured for the content type, then the throttle rate for a single content request is 500.

**For Multiple Requests without the Content Type Throttle:** The sender Satellite Server divides the Satellite Server output throttle rate by the number of requests to find the final throttle rate.

**For Multiple Requests with the Content Type Throttle:** First, the sender Satellite Server divides the Satellite Server output throttle rate by the number of requests. Next, the sender Satellite considers the rate that is set for the content type throttle. The sender Satellite then uses the smaller of the two rates as the final throttle rate.

For information about content type throttle, see “Throttle (in KB/sec):” on page 45.

Example:

The following table describes how the Satellite Server calculates the final throttle rate when you have specified 500 as the Satellite Server output throttle rate:
<table>
<thead>
<tr>
<th>No. of Requests</th>
<th>Content Type Throttle (A)</th>
<th>Satellite Server Output Throttle Rate after Dividing (B)</th>
<th>Final Throttle Rate (Minimum of A and B)</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>100</td>
<td>500/5=100</td>
<td>100</td>
</tr>
<tr>
<td>10</td>
<td>100</td>
<td>500/10=50</td>
<td>50</td>
</tr>
<tr>
<td>2</td>
<td>200</td>
<td>500/2=250</td>
<td>200</td>
</tr>
<tr>
<td>1</td>
<td>600</td>
<td>500/1=500</td>
<td>500</td>
</tr>
</tbody>
</table>
You can refresh a device so that any pending actions take place immediately.

1 Select the check box next to the Satellite that you want to refresh.
2 Click Action > Refresh Device.
   The QuickTask Status box is displayed while the action is in progress.
3 (Optional) To close the status dialog box, click Hide.
   The refresh action continues in the background.
4 (Optional) To cancel the refresh action, click the check box for the device, click Stop, then click Hide to close the dialog box.
13 Removing the Roles from a Satellite

You can choose to remove one or more roles from a Satellite. However, the Satellite must have at least one role configured for it to continue to perform the Satellite function. If you remove all the roles, the Satellite is demoted to be only managed device.

Removing a Satellite role does not remove the device from any of the non-default Closest Server rules. The device is removed from the non-default Closest Server rules only when it is no longer a Satellite.

To remove one or more roles from a Satellite:

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy panel, select the check box next to the Satellite from which you want to remove the role.
3. Click Actions > Configure Satellite Server.
4. In the Configure Satellite Server dialog box, deselect the check box next to the Satellite role you want to remove.
5. Click OK.

NOTE: If your Management Zone consists of ZENworks 11 Primary Servers and ZENworks 10.2.x/10.3.x Satellites, you cannot remove individual roles from the Satellites. You can only demote the Satellite to a managed device.
You can remove a Satellite from the Server Hierarchy listing when that device is no longer needed to perform Satellite functions. The Satellite can have any version of the ZENworks Adaptive Agent installed. The device’s object isn’t removed from ZENworks; it is just removed from the Server Hierarchy listing. The device is still a managed device in your ZENworks Management Zone. However, it will not contain the replicated content, imaging services and data, or the rolled-up collection information.

When you remove a Satellite, the managed devices that used it must be reconfigured to use another server for content, collection, imaging and authentication purposes. For more information, see “Adding Closest Servers to Locations” in the ZENworks 11 SP2 Location Awareness Reference.

You cannot use this option to remove a Primary Server from the listing.

To remove a Satellite:

1. For the Satellite that you want to remove, make a note of all devices that are using it for authentication, content, imaging, or collection information roll-up.

2. In ZENworks Control Center, click the Configuration tab.

3. In the Server Hierarchy panel, select the check box next to the Satellite that you want to remove from the zone.

4. Click Action > Remove Satellite Server.

5. To confirm the removal, click OK.

6. As necessary, reconfigure the managed devices that used the Satellite so that they can continue to receive content and roll up collection information.

   For more information, see “Adding Closest Servers to Locations” in the ZENworks 11 SP2 Location Awareness Reference.

7. (Conditional) The Imaging role is immediately removed from the device. If the role is not immediately removed, it is removed only during the next device refresh schedule. If you want to immediately remove the role from the device, manually refresh the device in one of the following ways:

   - In the ZENworks Control Center, click the Configuration tab > the Server Hierarchy, select the check box next to the devices you want to refresh, then click Action > Refresh Device.
On a managed device, do one of the following:

- Right-click the icon, then click Refresh.
- Execute the `zac ref` command from the console prompt.
Specifying Content to be Hosted

Because Content role devices retrieve their content from their parent Primary Servers, any content that you want hosted on a Satellite must also be hosted on its parent Primary Server.

When you create relationships between content and content servers (ZENworks Primary Servers and Satellites) by using the Select Content to Update Wizard, these relationships adds to any existing relationships. The selected content is hosted on the content server in addition to the content already existing on the server.

Consider the content for Bundle A and Policy B is hosted on Server 1 and not on Server 2. Select Bundle A and Policy B, then use the Select Content to Update Wizard to include the content on Server 2. During the next scheduled replication, Bundle A and Policy B are added to Server 2.

To specify the content to be hosted:

1. In ZENworks Control Center, click the Configuration tab. In the Server Hierarchy section, select the check boxes next to the Satellites with the Content role that you want to designate as the hosts for one or more pieces of content.

2. Click Action > Specify Content to launch the Select Content to Update Wizard.

3. In the Available Content list, select the desired content. You can use Shift+click and Ctrl+click to select multiple bundles or policies.

4. Click to move the selected content to the Selected Content list.

5. Click Next.

6. Click Finish to create the relationships between the content and the content servers.

Depending on the relationships created, the content is replicated to or removed from content servers during the next scheduled replication.
You can export content from a ZENworks Primary Server’s content repository and then manually import that content into a Satellite device’s content repository. This process is sometimes called offline content replication.

For more information about exporting content from the content repository, see the `zman satellite-server-export-content (ssec)` command under “Satellite Commands” in the ZENworks 11 Command Line Utilities Reference. After you export the content, you can copy it to a network drive or to a storage device and then manually import the content into the Satellite device’s content repository.

For more information about importing the content into a Satellite device’s content repository, see the `zac cdp-import-content (cic)` command under “Content Distribution Commands” in the ZENworks 11 Command Line Utilities Reference.

You cannot manually export content from one ZENworks Primary Server and then import that content into another Primary Server. For information about replicating content between Primary Servers, see Section 29, “Content Replication,” on page 95.
Moving a Satellite from One Primary Server to Another Primary Server

You can move a Satellite from its parent Primary Server to another Primary Server.

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy panel, select the check box next to the Satellite that you want to move, then click Move.
3. Select the Primary Server you want to be the Satellite’s new parent, then click OK.

Any content (bundles, policies, and patches) you want hosted on a Satellite with the Content role must also be hosted on its parent Primary Server. If the content is not hosted on the new Primary Server, it is added.
Specifying a Different Repository for the Content Role Satellite (Windows Only)

The content repository is located in the following default path on Windows Satellites:

\installation_path\zenworks\work\content-repo

To change the default path to another location accessible to the server:

1. Make sure that the disk drive you want to use is attached to the Satellite and is properly formatted.
   You do not need to specify a drive letter, but the server must recognize the hardware.
2. Make sure that there is no content in the default location (\installation_path\zenworks\work\content-repo) by doing one of the following:
   - If the content-repo directory is not present in the path given above, create the content-repo directory in that path.
   - If you need to save the content that is now in this directory, rename the existing directory and create a new empty directory named content-repo.
     You can later copy the content from the renamed directory to the new content repository location (see Step 9).
   - If you do not need any of the content in the existing content-repo directory, delete the directory and re-create the content-repo directory.
   An empty content-repo directory must exist to act as the pointer to the new content repository location for the Satellite.
3. Click Start, right-click the My Computer icon, then select Manage.
   You can also click Start, then enter compmgmt.msc at the Run command line.
4. Select Disk Management under the Storage section in the left pane.
   The disk drive you selected in Step 1 should be displayed.
5. Right-click the partition of the disk drive that you want to use as your content repository on the Satellite, then select Change Driver Letter and Paths.
   This is the disk drive (see Step 1) that you will mount to the content-repo directory.
6. Click Add.
   This displays the Add Drive Letter or Path dialog box.
7. Select Mount in the Following Empty NTFS Folder, then browse for and select the content-repo directory:
   \installation_path\zenworks\work\content-repo
8. Click OK as necessary to exit and save the configuration change.
9. If necessary (see Step 2), move the files from the old renamed content-repo directory to the new content-repo directory.
   This copies the files to the hard drive that you have selected for your new content repository.
Specifying a Different Repository for Content Role Satellite (Linux Only)

The content repository is located in the following default path on Linux Satellites:

/var/opt/novell/zenworks/content-repo/

To change the default path to another location accessible to the server, use one of the following ways:

- If you want to move the content repository to a different location on a different device, create an NFS volume on the device, mount the content-repo directory on the volume, and make the root user as the owner of the directory with Read, Write, and Execute permissions.

- If you want to move the content repository to a different location on the same Linux Satellite, mount the repository on a different volume that has sufficient disk space by using Soft Link.

- If you want to move the content repository to an OES device, create an NSS volume (CIFS share) on the device, mount the content-repo directory on the volume, and make the root user as the owner of the directory with Read, Write, and Execute permissions.

For more information, see Section 28.2, “Changing the Location of the Content Repository on a Linux Server,” on page 89.
To promote an RHEL 6 device as a Content or Collection Role Satellite, the firewall needs to allow communication over the HTTP port. However, due to SELinux policy rules, certain `iptables` commands such as `iptables-save` are denied write-access to the `iptables` configuration, due to which the firewall rules are not enforced.

To promote an RHEL 6 device as a Content or Collection Role Satellite:

1. Enable the permissive state for the security domain `iptables_t` using the following command:
   ```
   # semanage permissive -a iptables_t
   ```
2. Promote the device to a Content or Collection Role Satellite.

As an alternative workaround, you can also restart the Adaptive Agent service using the following command, before promoting a device to a Content or Collection Role Satellite:

```
/etc/init.d/novell-zenworks-xplatzmd restart
```
Promoting a Macintosh Device to Be a Content Role Satellite Server

1. Log in to ZENworks Control Center.
2. Click Configuration.
3. In the Server Hierarchy panel, select the Primary Server you want to promote.
4. Click Action > Add Satellite Server to display the Add Satellite Server dialog box.
5. In the Device to promote option, browse for and select a Macintosh device that is registered in the Management Zone, then click OK.
6. In the Satellite Server Roles panel, select Content.
7. Click OK.

On the Macintosh managed device:

1. Log in to the managed device as root.
2. Refresh the device.
3. Right-click the ZENworks icon and click Show Properties. The Macintosh device is promoted to the Content role.
22 Promoting a Macintosh Device to Be a Collection Role Satellite Server

1. Log in to ZENworks Control Center.
2. Click **Configuration**.
3. In the **Server Hierarchy** panel, select the Primary Server you want to promote.
4. Click **Action > Add Satellite Server** to display the **Add Satellite Server** dialog box.
5. In the **Device to promote** option, browse for and select a Macintosh device that is registered in the Management Zone, then click **OK**.
6. In the **Satellite Server Roles** panel, select **Collection**.
7. Click **OK**.

On the Macintosh Managed Device:

1. Log in to the managed device as **root**.
2. Refresh the device.
3. Right-click the ZENworks icon and click **Show Properties**. The Macintosh device is promoted to the **Collection** role.
Troubleshooting Satellites

The following section provides solutions to the problems you might encounter while working with Satellites:

- “Unable to add a Satellite with the Imaging role to a Windows managed device by using the zman ssc command” on page 73
- “Unable to remove a Satellite with the Imaging role from a Windows device by using the zman ssd command” on page 73
- “The managed device is not promoted to the Imaging Satellite role even though the role has been assigned to it” on page 73
- “Updated Imaging statistics are not displayed on the ZENworks icon when a Windows Vista SP2 managed device is promoted to be a Satellite with the Imaging role” on page 74

Unable to add a Satellite with the Imaging role to a Windows managed device by using the zman ssc command

Source: ZENworks 11; Satellite.

Action: To promote a Windows managed device to be a Satellite with the Imaging role, use the zman ssaimg command.

For more information about the zman ssaimg command, view the zman man page (man zman) on the ZENworks Server or see “Satellite Commands” in the ZENworks 11 Command Line Utilities Reference.

Unable to remove a Satellite with the Imaging role from a Windows device by using the zman ssd command

Source: ZENworks 11; Satellite.

Action: To remove the Imaging Satellite role from a Windows managed device, use the zman ssrimg command.

This command does not remove other Satellite roles such as Content or Collection if they are assigned to the device.

For more information about the zman ssrimg command, view the zman man page (man zman) on the ZENworks Server or see “Satellite Commands” in the ZENworks 11 Command Line Utilities Reference.

The managed device is not promoted to the Imaging Satellite role even though the role has been assigned to it

Source: ZENworks 11; Satellite.
Possible Cause: The managed device is unable to contact the Primary Server because of the firewall settings configured on the managed device.

Action: Do the following on the managed device:

1. Disable the firewall settings.
2. Ping the Primary Server to make sure that the managed device can contact the server.
3. Refresh the information on the icon by right-clicking the icon, then clicking Refresh.

Updated Imaging statistics are not displayed on the ZENworks icon when a Windows Vista SP2 managed device is promoted to be a Satellite with the Imaging role

Source: ZENworks 11; Satellite.

Explanation: When you promote a Windows Vista SP2 managed device to be a Satellite with the Imaging role, any updated Imaging statistics are not displayed on the icon (Show Properties > Satellite > Imaging)

Action: To view the latest Imaging statistics on the Satellite:

1. At the console prompt, go to \ZENworks_installation_directory\novell\zenworks\bin\preboot.
2. Run the following command:

   `zmgmcast -status -i Satellite_IP_address`
Server Hierarchy

Your Management Zone’s server hierarchy determines the relationships among the ZENworks Primary Servers and Satellites. These relationships control the flow of content and information within the zone. Proper configuration can help you to minimize network traffic between network segments connected by slow links.

- Chapter 24, “Primary Servers: Peer Versus Parent/Child Relationships,” on page 77
- Chapter 25, “Satellite Role Relationships,” on page 79
- Chapter 26, “Changing the Parent-Child Relationships of Primary Servers,” on page 81
By default, each Primary Server that you add to the system is created as a peer to all other Primary Servers. Being in a peer relationship enables a Primary Server to:

- Have direct write access to the ZENworks database so that it can add information (inventory, messages, and status).
- Retrieve device configuration information directly from the database.
- Pull content (bundles, policies, system updates, and patches) from any Primary Server.

Direct write access to the ZENworks database requires a JDBC/ODBC connection. If a Primary Server is located on the network so that it cannot effectively access the ZENworks database via a JDBC/ODBC connection, you can configure the Primary Server to be a child of another Primary Server that does have direct write access to the database. However, you should try to maintain peer relationships between your Primary Servers unless your network connections do not allow it.

Being in a child relationship instructs a Primary Server to use HTTP to roll up inventory, message, and status information to its parent Primary Server, which then writes the information to the database. However, the child Primary Server still retrieves configuration information from the database and passes configuration information back up to the database. For this reason, the child Primary Server must have a direct connection to the ZENworks database.

We do not recommend having a Primary Server across a WAN link from the ZENworks database because this causes increased traffic across the network. We recommend that you use a Satellite device across a WAN link. For more information, see Section 25, “Satellite Role Relationships,” on page 79.
Satellite Role Relationships

A Satellite is a device that can perform certain roles that a ZENworks Primary Server normally performs. A Satellite can be any managed Windows or Linux device (server or workstation), but not a Primary Server. The ZENworks version installed on the managed device must be same as that of the Primary Server. When you configure a Satellite, you specify which roles it performs (Authentication, Collection, Content or Imaging). A Satellite can also perform roles that might be added by third-party products that are snap-ins to the ZENworks 11 framework. For more information about the tasks you can perform on Satellites, see Chapter II, “Satellites,” on page 33.

The following sections contain more information:

- Section 25.1, “Authentication Role Server Relationships,” on page 79
- Section 25.2, “Content Role Server Relationships,” on page 79
- Section 25.3, “Collection Role Server Relationships,” on page 79
- Section 25.4, “Imaging Role Server Relationships,” on page 79

25.1 Authentication Role Server Relationships

An Authentication role identifies a managed device that is able to authenticate devices to the ZENworks Management Zone. When you set up a device to function with a Authentication role, you must specify a Primary Server as its parent.

25.2 Content Role Server Relationships

A Content role identifies a managed device that is able to distribute content (bundles, policies, system updates, and patches) to other devices. When you set up a device to function with a Content role, you must specify a Primary Server as its parent. The device with the Content role receives all content from its parent Primary Server.

25.3 Collection Role Server Relationships

A Collection role causes a managed device to collect inventory information, messages (errors, warning, informational, and so forth), and policy and bundle statuses, then rolls that information up to its parent Primary Server, which in turn either writes to the database directly or passes the information on to its parent Primary Server, which does the database writing.

25.4 Imaging Role Server Relationships

An Imaging role causes a managed device to take and restore images within as well as across subnets by using unicast or multicast imaging.
You can move a Primary Server to be a peer or child of other Primary Servers:

- Section 26.1, “Making a Primary Server a Child,” on page 81
- Section 26.2, “Making a Primary Server a Peer,” on page 81

### 26.1 Making a Primary Server a Child

You can place a Primary Server as a child of another Primary Server. This child Primary Server no longer writes collection data directly to the ZENworks database; instead, it passes its information on to its parent Primary Server, which does the database writing. However, the child Primary Server still retrieves configuration information from the database and passes configuration information back up to the database. For this reason, the child Primary Server must have a direct connection to the ZENworks database.

To make a Primary Server a child of another server:

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy panel, select the check box next to the Primary Server you want to make a child.
3. Click Move to display the Move Device dialog box.
4. Select the Primary Server that you want to be its parent server.
5. Click OK.

### 26.2 Making a Primary Server a Peer

This places the Primary Server back to the first level of the hierarchy, or moves it to be a child of another Primary Server if it is nested more than one level deep.

If you move a Primary Server back to the first level, it writes directly to the ZENworks database.

1. In ZENworks Control Center, click the Configuration tab.
2. In the Server Hierarchy panel, select the check box next to the Primary Server you want to make a peer.
3. Click Move to display the Move Device dialog box.
4. Do one of the following:
   - Select None to move it up to the first level of servers in the listing.
   - Select another Primary Server to be the parent server.
5. Click OK.
The following sections provide information to help you ensure that content is replicated correctly among the devices in your ZENworks Management Zone:

- Chapter 27, “Replicated Content,” on page 85
- Chapter 28, “Content Repository,” on page 87
- Chapter 29, “Content Replication,” on page 95
- Chapter 30, “Content Delivery,” on page 103
- Chapter 31, “Content Sharing,” on page 107
- Chapter 32, “Troubleshooting,” on page 113
ZENworks replicates and distributes content among Primary Servers, Satellites, and managed devices. This includes the following content:

- **Bundles:** The files, configuration settings, installation instructions, and so forth required to deploy and manage an application or files on a device. Used in ZENworks Configuration Management and ZENworks Patch Management.

- **Policies:** The set of rules that control a range of hardware and software configuration settings on managed devices. Used in ZENworks Configuration Management.

- **Patches:** The files and instructions required to update existing software on a managed device. Used in ZENworks Patch Management.

- **System Updates:** The software updates for ZENworks system components. Used in ZENworks Configuration Management, ZENworks Asset Management, ZENworks Patch Management, ZENworks Endpoint Security Management and ZENworks Full Disk Encryption.
Each ZENworks Server contains a content repository. The content repository stores all bundle, policy, patch management and system update content that has been replicated to the server and any images that have been captured and stored to the server.

ZENworks 11 supports any filesystem to host the content repository, although each filesystem has advantages and limitations. For example, the XFS filesystem handles very large files, which can be an advantage, depending on the nature of the content in the repository.

A single content repository cannot be shared by multiple Primary Servers. Each server must use its own content repository.

The content repository is self-maintaining. Whenever you add a bundle or policy, the bundle or policy content is added to the appropriate content repositories based upon the replication settings. Whenever you remove a bundle or policy or change which servers host its content, the bundle or policy content is also removed from the appropriate servers.

If necessary, you can move the content repository to a different location. The following sections provide instructions:

- Section 28.1, “Changing the Location of the Content Repository on a Windows Server,” on page 87
- Section 28.2, “Changing the Location of the Content Repository on a Linux Server,” on page 89
- Section 28.3, “Mounting the Content Repository on a Linux Server to an NSS Volume,” on page 90
- Section 28.4, “Changing the Location of the Temporary Location on a Windows Server,” on page 91
- Section 28.5, “Changing the Location of the Temporary Location on a Linux Server,” on page 93

### 28.1 Changing the Location of the Content Repository on a Windows Server

The content repository is found in the following location on a Windows server:

```
installation_path\zenworks\work\content-repo
```

You can specify a different disk drive to be your content repository. In Windows, this is done by “mounting” the drive. Mounting is simply pointing an existing path to a hard drive partition without the use of mapped drive letters.

In the following steps, you mount the default content repository location to a disk drive partition, which becomes the new content repository:

1. Make sure that the disk drive you want to use is attached to the server and is properly formatted as NTFS.
This disk drive can be an existing or new one for the machine. The hardware must be recognized by the server. However, do not specify a drive letter if you are adding a new disk drive to the machine. Windows does not allow mounting to a drive letter.

2 Stop all ZENworks Services.

3 Because an empty content-repo directory must exist in the default location (*installation_path*\zenworks\work\content-repo) to be the pointer to the new content repository location, do one of the following to make sure that there is no content in the default location:

   - If you need to save the content that is now in this directory, rename the existing directory and create a new directory named content-repo.
     You can later copy the content from this renamed directory to the new content repository location (see Step 11).
   - If you do not need any of the content in the existing content-repo directory, delete the directory and re-create it.
   - If the content-repo directory is not present in the path given above, create the path and directory.

4 Click Start, right-click the My Computer icon, then select Manage.
   You can also click Start, then enter compmgmt.msc at the Run command line.

5 Select Disk Management under the Storage section in the left pane.
The disk drive you selected in Step 1 should be displayed in the right pane.

6 (Conditional) If a driver letter is associated with the partition that you want to use as the new content repository location, do the following:

   6a In the Computer Management dialog box, right-click the drive’s partition.
   6b Select Change Drive Letter and Paths.
   6c Select the drive letter.
   6d Click Remove, then select Yes to confirm.

7 Right-click the partition of the disk drive that you want to use as your content repository, then select Change Driver Letter and Paths.
   This is the disk drive that you will mount to the content-repo directory in Step 9.

8 Click Add.
   This displays the Add Drive Letter or Path dialog box.

9 Select Mount in the Following Empty NTFS Folder, browse for and select the default content-repo directory, then click Next.
   The default directory is *installation_path*\zenworks\work\content-repo.
   This mounts the default path to the hard drive partition that you selected in Step 7.
   If necessary, format the drive as NTFS using the Computer Management feature in Windows.

10 Click the buttons as necessary to exit and save the configuration change.

11 (Conditional; see Step 3) Copy the files from the old renamed content-repo directory to the new content-repo directory.

12 Start all ZENworks Services.
   From this point on, all ZENworks 11 data is written directly to the new content repository location on the selected hard drive partition.
28.2 Changing the Location of the Content Repository on a Linux Server

You can store your data on a local mount or on a network share such as NFS, SMB, or CIFS and mount the share in your `content-repo` directory to access your data.

You can also create a symbolic link on your local hard drive if you want to store your data elsewhere on your local device. However, the existing `content-repo` directory must be deleted.

1. (Optional) Run the following command to move the content from the `content-repo` directory to a new directory on the disk to which you want to create the symbolic link:

   ```bash
   mv /var/opt/novell/zenworks/content-repo/* another-local-directory-on-device
   ```

2. Run the following command to delete the `content-repo` directory:

   ```bash
   rm -rf /var/opt/novell/zenworks/content-repo/
   ```

3. Run the following command to create the symbolic link to the new directory where you want to store the data:

   ```bash
   ln -s another-local-directory-on-device /var/opt/novell/zenworks/content-repo
   ```

   See the `ln(1)` man page for more information about how to symbolically link directories.

   **NOTE:** You do not need to perform Step 4 if you are trying to configure the content repository on a Linux Satellite Server.

4. ZENworks requires that the ZENworks user has complete ownership rights on the directory to which you have created the symbolic link. Run the following command to make the ZENworks user the owner of this directory:

   ```bash
   chown zenworks:zenworks -R /var/opt/novell/zenworks/content-repo/
   ```

   See the `chown(1)` man page for more information about how to change ownership of directories.

The following sections provide information on managing content repository locations on Linux.

- Section 28.2.1, “Mounting a Share,” on page 89
- Section 28.2.2, “Unmounting a Share,” on page 90
- Section 28.2.3, “Creating a Permanent Mount,” on page 90
- Section 28.2.4, “Moving Existing Content to the New Repository,” on page 90

28.2.1 Mounting a Share

After configuring a share on a remote machine, you can mount it from `/var/opt/novell/zenworks/content-repo`. Stop all ZENworks Services before mounting the share.

Use the following command to mount the share:

```bash
mount -t cifs -o username=username //example.machine.com/share_name /var/opt/novell/zenworks/content-repo
```

In the command, `//example.machine.com/share-name` is the share to mount and `/var/opt/novell/zenworks/content-repo` is the mount point.

If you only need to store the data from part of your content repository on another share, you can also do that. For example, if you need to store your ZENworks image files on another share, you can use the following command:
mount -t cifs -o username= //example.machine.com/share_name /var/opt/novell/zenworks/content-repo/images

Or, to store bundle and policy content on another share, you can use the following command:

mount -t cifs -o username= //example.machine.com/share_name /var/opt/novell/zenworks/content-repo/content

Start all ZENworks Services after the share is mounted.

### 28.2.2 Unmounting a Share

The mount that you created in “Mounting a Share” on page 89 is temporary; the share is unmounted when the operating system is shut down or rebooted. You can also use the following command to manually unmount the share:

umount /var/opt/novell/zenworks/content-repo

Stop all ZENworks Services before unmounting the share and start all ZENworks Service after the share is unmounted.

### 28.2.3 Creating a Permanent Mount

Stop all ZENworks Services before creating a permanent mount and start all ZENworks Service after the permanent mount is created.

To ensure that the mount occurs each time the Linux server starts, you must add the following entry to your `/etc/fstab` configuration file:

//example.machine.com/share_name /var/opt/novell/zenworks/content-repo cifs credentials=path_to_credentials_file 0 0

The credentials file listed in the command contains a username and password. For more information, see the `mount.cifs(8)` man page. The format of the credentials file is:

username=value
password=value

### 28.2.4 Moving Existing Content to the New Repository

After you change the location of a content repository by mounting a new share, any content in the old location is no longer available. To make it available, you must move it to the new repository. Stop all ZENworks Services before moving existing content to the new repository and start all ZENworks Service after the existing content is moved.

### 28.3 Mounting the Content Repository on a Linux Server to an NSS Volume

You can mount the `content-repo` directory on a Linux server on to an NSS Volume.

Before you begin, ensure that the following prerequisites are met:

- The NSS volume is set up and mounted in the `/media/nss/NSSVOL/` directory of the server.
The Samba service is installed and configured to run as root on the server. To verify this, run the following command and ensure that the value in UID column is root, especially for the processes with PPID = 1.

```
ps -Alf | grep samba
```

To mount the content-repo directory:

1. Go to the `/etc/init.d/` directory and stop the novell-zenserver, novell-zenloader, and novell-zenmntr services.
2. Run the following command to move the content from the content-repo directory to a temporary directory on the disk so that the content-repo directory is empty:

```
mv /var/opt/novell/zenworks/content-repo/* another-local-directory-on-device
```
3. Go to the `/media/nss/NSSVOL` directory, and create a zencontent subdirectory within it.
4. Use YaST to add the newly created subdirectory to the list of Samba shares (for example, zenshare) on the server.
5. Restart the Samba service.
6. (Conditional) Run the following command to add a Samba root user if the Samba root user does not already exist:

```
smbpasswd -a root
```
    For security reasons, you must specify a root password that is different from the login password.
7. (Optional) To test if the newly created share is accessible over the Samba protocol, access the share from a Windows device by providing the Samba root user credentials.
8. Run the following command to mount the zenshare share:

```
mount //localhost/zenshare /var/opt/novell/zenworks/content-repo -t cifs -o username=root
```
9. Restore the backed-up content to the `/var/opt/novell/zenworks/content-repo` directory. The content is now stored on the NSS volume.
10. Go to the `/etc/init.d/` directory and restart the novell-zenserver, novell-zenloader, and novell-zenmntr services.
11. (Conditional) To ensure that the share is automatically mounted every time the server reboots, add the following line in the `/etc/fstab` file:

```
//localhost/zenshare /var/opt/novell/zenworks/content-repo cifs username=root,password=rootpass 0 0
```

### 28.4 Changing the Location of the Temporary Location on a Windows Server

Creating bundles that contain content temporarily requires up to twice the amount of disk space as the original files. The bundle creation process uploads copies of the original files from the local machine to a temporary directory on the ZENworks content server. The process then packages those files as encrypted, compressed ZENworks content files. After the ZENworks content files are created, the original uploaded files are automatically deleted.

When the bundle is created in ZENworks Control Center, the temporary files are stored in the `installation_path\zenworks_home\share\tomcat\temp` location.
If the space on the default temporary location is insufficient, you can specify a different disk drive to be the location of temporary files. In Windows, this is done by “mounting” the drive. Mounting is simply pointing an existing path to a hard drive partition without the use of mapped drive letters.

In the following steps, you mount the default temporary location to a disk drive partition, which becomes the new temporary location:

1. Make sure that the disk drive you want to use is attached to the server and is properly formatted as NTFS.

   This disk drive can be an existing or new one for the machine. The hardware must be recognized by the server. However, do not specify a drive letter if you are adding a new disk drive to the machine. Windows does not allow mounting to a drive letter.

2. Stop all ZENworks Services.

3. Click Start, right-click the My Computer icon, then select Manage.

   You can also click Start, then enter compmgmt.msc at the Run command line.

4. Select Disk Management under the Storage section in the left pane.

   The disk drive you selected in Step 1 should be displayed in the right pane.

5. (Conditional) If a driver letter is associated with the partition that you want to use as the new content repository location, do the following:

   5a. In the Computer Management dialog box, right-click the drive’s partition.

   5b. Select Change Drive Letter and Paths.

   5c. Select the drive letter.

   5d. Click Remove, then select Yes to confirm.

6. Right-click the partition of the disk drive that you want to use as your temporary location, then select Change Driver Letter and Paths.

   This is the disk drive that you will mount to the temporary location directory in Step 9.

7. Click Add.

   This displays the Add Drive Letter or Path dialog box.

8. Select Mount in the Following Empty NTFS Folder, browse for and select the default temporary location directory, then click Next.

   The default directory is installation_path\zenworks_home\share\tomcat\temp.

   This mounts the default path to the hard drive partition that you selected in Step 7.

   If necessary, format the drive as NTFS using the Computer Management feature in Windows.

9. Click the buttons as necessary to exit and save the configuration change.

10. Start all ZENworks Services.

    From this point on, all ZENworks 11 data is written directly to the new temporary location on the selected hard drive partition.
28.5 Changing the Location of the Temporary Location on a Linux Server

You can store your data on a local mount or on a network share such as NFS, SMB, or CIFS and mount the share in your temporary directory to access your data.

You can also create a symbolic link on your local hard drive if you want to store your data elsewhere on your local device. However, the existing temporary location directory must be deleted.

1. Run the following command to create the symbolic link to the new directory where you want to store the data:
   ```bash
   ln -s another-temporary-directory-on-device /var/temp/
   ```
   See the ln(1) man page for more information about how to symbolically link directories.

2. ZENworks requires that the ZENworks user has complete ownership rights on the directory to which you have created the symbolic link. Run the following command to make the ZENworks user the owner of this directory:
   ```bash
   chown zenworks:zenworks -R /var/temp/
   ```
   See the chown(1) man page for more information about how to change ownership of directories.

The following sections provide information on managing content repository locations on Linux.

- Section 28.5.1, “Mounting a Share,” on page 93
- Section 28.5.2, “Unmounting a Share,” on page 93
- Section 28.5.3, “Creating a Permanent Mount,” on page 94

28.5.1 Mounting a Share

After configuring a share on a remote machine, you can mount it from /var/temp/. Stop all ZENworks Services before mounting the share.

Use the following command to mount the share:

```bash
mount -t cifs -o username=username //example.machine.com/share_name /var/temp/
```

In the command, `//example.machine.com/share-name` is the share to mount and `/var/temp/` is the mount point.

Start all ZENworks Services after the share is mounted.

28.5.2 Unmounting a Share

The mount that you created in “Mounting a Share” on page 89 is temporary; the share is unmounted when the operating system is shut down or rebooted. You can also use the following command to manually unmount the share:

```bash
umount /var/temp/
```

Stop all ZENworks Services before unmounting the share and start all ZENworks Service after the share is unmounted.
28.5.3 Creating a Permanent Mount

Stop all ZENworks Services before creating a permanent mount and start all ZENworks Service after the permanent mount is created.

To ensure that the mount occurs each time the Linux server starts, you must add the following entry to your `/etc/fstab` configuration file:

```
//example.machine.com/share_name /var/temp/ cifs
credentials=path_to_credentials_file 0 0
```

The credentials file listed in the command contains a username and password. For more information, see the `mount.cifs(8)` man page. The format of the credentials file is:

```
username=value
password=value
```
Content Replication

When you add a bundle or policy that contains files, the files are uploaded to the content repository on the ZENworks Server. In addition, the ZENworks database is updated to reflect the addition of the bundle or policy and its content.

ZENworks Servers and Satellite devices, collectively referred to as content servers, periodically read the ZENworks database to discover new bundles and policies. Each content server that does not have the bundle or policy content retrieves it from the content server where it resides.

There are a variety of settings you can use to control how content is replicated among content servers in your zone.

Content Replication settings can be inherited from the following locations:

- **(System):** The bundle is inheriting the setting established for the Management Zone (Configuration tab > Management Zone Settings > Content > Content Replication).
- **Folder:** The bundle is inheriting the setting established for one of its parent folders.
- **Bundle:** The bundle is not inheriting the setting, but the setting is configured directly on the bundle.
- **---:** The bundle is not inheriting the setting and the setting is not configured directly on the bundle. In other words, the setting is not configured at the system level, the folder level, or the bundle level.

If the settings are configured at the system or folder level, click **Override settings** to enable you to configure the setting at the bundle or policy level.

If you are configuring settings on a bundle folder or policy folder, you can click **Force Inheritance** in the **Folder Task** list in the left navigation pane to ensure that all children (all subfolders as well as individual bundles and policies) inherit the settings.

Content replication settings let you:

- Specify whether content is replicated to new content servers by default.
- Manually include content on or exclude content from content servers.
- Schedule how often replication occurs.
- Set a limit, or throttle, on the maximum amount of content that is replicated per second from one content server to another.
- Specify whether you want the ZENworks Agent on managed devices or Satellite devices to use checksum comparison to help ensure that no errors were introduced during content replication and that the content was not altered.

For information about performing these tasks, see the following sections:

- Section 29.1, “Configuring Content Replication at the Management Zone Level,” on page 96
- Section 29.2, “Replicating Content to New Content Servers,” on page 97
29.1 Configuring Content Replication at the Management Zone Level

1. In ZENworks Control Center, click the Configuration tab.
2. In the Management Zone Settings panel, click Content > Content Replication.
3. Fill in the fields:

   **Primary Server Recurring Content Replication Schedule:** Use the Days, Hours, and Minutes fields to set the schedule.
   You can use any combination of the fields. For example, to specify every 30 hours, you can enter 30 hours or 1 day, 6 hours.

   **NOTE:**
   - We recommend you to set the schedule to 12 hours.
   - If a Satellite device is at the end of a very slow link (for example, a 128K WAN), you might want to disable the content replication schedule so that content can be manually replicated by using the `zac wake-cdp (cdp)` command. For more information about the `zac wake-cdp` command, see “Content Distribution Commands in the ZENworks 11 Command Line Utilities Reference”.

   To disable the content replication schedule on a Satellite device set the Schedule Type to No Schedule. For more information on setting the schedule type, see Section 10.3, “Understanding the Content Role,” on page 36.

   **Primary Server Output Throttling in KB/Sec:** Select the throttling rate you want to use.
   This rate applies to all ZENworks Servers in your zone. You cannot set individual throttling rates.
   The content replication throttling rate determines the maximum amount of content (in kilobytes per second) that a ZENworks Server transfers when replicating content to other content servers or when distributing content to managed devices.
   By default, no throttling rate is imposed, which means that a ZENworks Server uses all available bandwidth.

   **Agent Content Checksum:** Specify whether the ZENworks Agent on managed devices computes the checksum of downloaded content and compares that checksum to the stored checksum for that content on the ZENworks Primary Server.
   Comparing checksums helps to ensure that no errors were introduced during the downloading of the content and that the content was not altered.
   Under normal conditions, you should use the default of **On**. If your ZENworks System has serious performance issues, you can set this setting to **Off** to increase performance.

   **Satellite Content Checksum:** Specify whether the ZENworks Agent on Satellite devices computes the checksum of downloaded content and compares that checksum to the stored checksum for that content on the ZENworks Primary Server.
Comparing checksums helps to ensure that no errors were introduced during content replication and that the content was not altered.

Under normal conditions, you should use the default of On. If your ZENworks System has serious performance issues, you can set this setting to Off to increase performance.

4 Click Apply or OK to save the changes.

29.1.1 Manually Configuring the Web Service Timeout Advanced Content Replication Setting

You can adjust the Web Service Timeout value to suit your needs. For example, if a Satellite device is across a slow WAN link and there is missing content, the default 240-second timeout value might not be long enough to make the Web service call.

To modify the Web Service Timeout on a Satellite device:

For Windows, create the following string value in the registry on the Satellite device:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Novell\ZCM\CDPWebCallWaitTimeout
```

and set the value to the desired number of milliseconds.

For Linux, in the `/etc/opt/novell/zenworks/conf/xplatzmd.properties` file on the Satellite device, add the following line:

```
CDPWebCallWaitTimeout=xxx
```

where `xxx` is the desired timeout value in milliseconds.

29.2 Replicating Content to New Content Servers

By default, when a new ZENworks server is added to the zone, all bundle and policy content is replicated to that ZENworks server. You can, however, choose not to replicate a specific bundle or content policy. If a new content Satellite Server is added to the zone, no content is replicated on the satellite server, unless specified.

For example, assume that you have a bundle for Microsoft Office. You’ve included it on specific content servers and don’t want it replicated to additional servers. To keep this from happening, you modify the Microsoft Office bundle’s replication settings to exclude replication to new content servers.

1 In ZENworks Control Center, go to the details page for the object (bundle, policy, or folder) whose replication setting you want to modify, then click the Settings tab.

2 To configure the settings on a bundle, click Bundle Management, then click Primary Server Replication or Satellite Server Replication.

   or

   To configure the settings on a policy, click Policy Management, then click Primary Server Replication or Satellite Server Replication.

   or

   To configure the settings on a bundle or policy folder, click Content, then click Primary Server Replication or Satellite Server Replication.

3 In the Primary Server Replication Status section, click the appropriate buttons to include or exclude new Primary Servers from hosting the content.
4 In the Satellite Server Replication Status section, click the appropriate buttons to include or exclude new Satellite Servers from hosting the content.

5 (Optional) In the Search option, type the string to be used to filter the Server (Primary or Satellite) then press Enter.

6 (Optional) If you are configuring settings on a bundle folder or policy folder, click Force Inheritance in the Folder Task list in the left navigation pane to ensure that all children (all subfolders as well as individual bundles and policies) inherit the settings. Be aware that settings configured on children are lost and that this action cannot be undone.

7 Click OK to save the changes.

29.3 Manually Replicating Content from a Primary Server to Satellite Devices

You can export content from a ZENworks Primary Server’s content repository and then manually import that content into a Satellite device’s content repository. This process is sometimes called offline content replication.

For more information about exporting content from the content repository, see the `zman satellite-server-export-content (ssec)` command under “Satellite Commands” in the ZENworks 11 Command Line Utilities Reference. After you export the content, you can copy it to a network drive or to a storage device and then manually import the content into the Satellite device’s content repository.

For more information about importing the content into a Satellite device’s content repository, see the `zac cdp-import-content (cic)` command under “Content Distribution Commands” in the ZENworks 11 Command Line Utilities Reference.

You cannot manually export content from one ZENworks Primary Server and then import that content into another Primary Server.

29.4 Including or Excluding Content

The default replication setting determines whether content is automatically replicated to new content servers (see Section 29.2, “Replicating Content to New Content Servers,” on page 97). You configure the setting for each bundle, policy, or folder. If you choose to include a bundle’s or policy’s content on new content servers, it is replicated to all new servers; likewise, if you choose to exclude the content, it is not replicated to any new servers.

In some cases, the default replication settings might not give you the desired replication scope for your content, or the scope might change. If this occurs, you can manually include content on or exclude it from specific content servers. There are three ways to do this:

- Section 29.4.1, “Managing a Single Piece of Content on Multiple Content Servers,” on page 99
- Section 29.4.2, “Managing Content on the Folder Level,” on page 99
- Section 29.4.3, “Managing Multiple Pieces of Content on a Single Content Server,” on page 100
- Section 29.4.4, “Managing Multiple Pieces of Content on Multiple Content Servers,” on page 100
29.4.1 Managing a Single Piece of Content on Multiple Content Servers

This section provides instructions for managing the replication of a single bundle’s or policy’s content to multiple content servers.

1. In ZENworks Control Center, go to the details page for the bundle or policy whose content replication you want to manage.

2. Click the Settings tab, click Bundle Management or Policy Management, then click Primary Server Replication or Satellite Server Replication.

   The Primary Server Replication Status panel and the Satellite Server Replication Status panel display all content servers in the zone. If the bundle or policy content is included on a content server, the Included column displays a ✓ icon.

3. To change the replication status for a content server, select the check box next to the server, then click Include to include the content on the server, or click Exclude to exclude the content from the server.

   As you include or exclude content servers, be aware of the following replication rules:
   - If a ZENworks Server is the parent server for one or more Satellite devices, you can’t exclude the content from the ZENworks Server without first excluding it from the Satellite devices.
   - If you have only one ZENworks Server in your Management Zone, you can’t exclude the content from it.
   - You can’t include a Satellite devices without first including the Satellite devices’s parent ZENworks Server.

4. Click Apply, then click OK.

29.4.2 Managing Content on the Folder Level

This section provides instructions for managing the replication of the content in a bundle or policy folder.

1. In ZENworks Control Center, go to the details page for the bundle or policy folder whose content replication you want to manage.

2. Click the Settings tab, then click Content.

3. Click Primary Server Replication or Satellite Server Replication.

   The Primary Server Replication Status panel and the Satellite Server Replication Status panel display all content servers in the zone. If the bundle or policy content is included on a content server, the Included column displays a ✓ icon.

4. To change the replication status for a content server, select the check box next to the server, then click Include to include the content on the server, or click Exclude to exclude the content from the server.

   As you include or exclude content servers, be aware of the following replication rules:
   - If a ZENworks Server is the parent server for one or more Satellite devices, you can’t exclude the content from the ZENworks Server without first excluding it from the Satellite devices.
   - If you have only one ZENworks Server in your Management Zone, you can’t exclude the content from it.
   - You can’t include a Satellite devices without first including the Satellite devices’s parent ZENworks Server.
5  (Optional) Click Force Inheritance in the Folder Task list in the left navigation pane to ensure that all children (all subfolders as well as individual bundles and policies) inherit the settings.

6  Click Apply, then click OK.

29.4.3 Managing Multiple Pieces of Content on a Single Content Server

This section provides instructions for managing the replication of the content for multiple bundles or policies to a single content servers.

1  In ZENworks Control Center, go to the details page for the content server whose content replication you want to manage.

2  Click the Content tab.

The Replication Settings panel displays all bundles and policies in the zone. If the bundle or policy content is included on the content server, the Included column displays a ✔ icon.

3  To change the replication status for a bundle or policy, select the check box next to the bundle or policy, then click Include to include its content on the server, or click Exclude to exclude its content from the server.

As you include or exclude content from the server, be aware of the following replication rules:

- If a ZENworks Server is the parent server for one or more Satellite devices, you can’t exclude the content from the ZENworks Server without first excluding it from the Satellite devices.
- If you have only one ZENworks Server in your Management Zone, you can’t exclude the content from it.
- You can’t include a Satellite devices without first including the Satellite devices’s parent ZENworks Server.

4  Click Apply, then click OK.

29.4.4 Managing Multiple Pieces of Content on Multiple Content Servers

You can use the Specify Content Wizard to include multiple pieces of content on multiple content servers. For example, you might have four bundles that you want included on two of your four content servers. Rather than managing the replication for the individual bundles (see “Managing a Single Piece of Content on Multiple Content Servers” on page 99) or the individual content servers (see “Managing Multiple Pieces of Content on a Single Content Server” on page 100), you can use the wizard to manage the replication for all four bundles and content servers at one time.

1  In ZENworks Control Center, click the Devices tab, then click the Servers folder to open it.

2  Select one or more servers on which you want to manage the content.

3  Click Action > Specify Content.

or

In the Server Tasks list in the left navigation pane, click Specify Content to launch the wizard.

4  On the Select Content to Update page, select the content and move it from the Available Content list to the Selected Content list.

5  Click Finish.

You can also launch the Specify Content Wizard from the following location: Configuration page> Server Hierarchy panel.

If you need more information about a wizard page, click the Help button.
29.5 Replicating Content to Primary Servers

You can replicate a bundle’s or policy’s content to a Primary Server immediately without waiting for the scheduled content replication.

1 In ZENworks Control Center, click the Devices tab on the left, select one of the Primary Servers and click Content.

2 In the Replication settings panel under the Content tab, select the content (bundle or policy) you want to replicate immediately to the selected Primary Server.

3 Click Actions > Replicate Now.
   The selected bundle or policy content will be included on a content server and the Included column displays a check mark.

4 If you click Advanced, the Status column displays the content as Available, based on the content size. Once marked as available, the content will be available in the repository of the selected Primary Server.

NOTE: The Replicate Now option is applicable only for the Primary Servers and not for the Satellite Servers.

29.6 Cleaning up Content from the Primary Server

You can cleanup a bundle’s or policy’s content from a Primary Server immediately without waiting for the scheduled content cleanup.

1 In ZENworks Control Center, click the Devices tab on the left, select one of the Primary Servers and click Content.

2 In the Replication Settings panel under the Content tab, select the check box for the content (bundle or policy) you want to cleanup immediately from the selected Primary Server.

3 Click Actions > Cleanup Now.
   The content will be removed from the Included column. The content will be removed also from the repository of the selected Primary Server.

NOTE: The Cleanup Now option is applicable only for the Primary Servers and not for the Satellite Servers. The content will not be cleaned up if that is the only Primary server where the content is hosted.
Content delivery, or distribution, refers to the process of transferring bundle and policy content from a content server (ZENworks Primary Server or Satellite with the Content role) to a managed device. There are a variety of settings you can use to determine how content is delivered to managed devices, such as setting up Closest Server rules, setting delivery blackout dates for when content can’t be downloaded, and setting how often you want managed devices to look for new content to download.

For information about performing these tasks, see the following sections:

- Section 30.1, “Setting Up Location Closest Server Rules,” on page 103
- Section 30.2, “Scheduling Delivery Blackout Dates,” on page 103
- Section 30.3, “Setting the Device Refresh Schedule,” on page 104

### 30.1 Setting Up Location Closest Server Rules

When you have multiple content servers, you can use the Closest Server rules to determine from which content server a managed device receives its content. By associating content servers with locations, you can ensure that a device accesses the closest content server even when the device changes location. The Closest Server rules for a location let you map devices to content servers based on many network parameters (DNS names, IP addresses, Gateways, and so forth).

For more information, see “Adding Closest Servers to Locations” in the ZENworks 11 SP2 Location Awareness Reference.

### 30.2 Scheduling Delivery Blackout Dates

If there are times when you don’t want managed devices to download content, you can create a content blackout schedule. Schedules can be defined at the following levels:

- **Management Zone**: The schedule is inherited by all devices.
- **Device Folder**: The schedule is inherited by all devices within the folder and its subfolders. It overrides the Management Zone blackout schedule.
- **Device**: The schedule applies only to the device for which it is defined. It overrides any schedules set at the Management Zone and folder levels.

A blackout schedule can include one or more time periods.

**NOTE:** The Content Blackout Schedule setting lets you prevent managed devices from downloading content from a content source during the blackout period. This setting, however, does not affect content replication. For this reason, a Satellite device with the Content role can still replicate content from its parent primary server during the blackout period.
To create a content blackout schedule:

1. Launch ZENworks Control Center.

2. Do one of the following:
   - To create a content blackout schedule for your Management Zone, click the Configuration tab, then click Content (in the Management Zone Settings panel) > Content Blackout Schedule.
   - To create a content blackout schedule for a device folder, open the folder’s details page, then click Settings > Content (in the Settings panel) > Content Blackout Schedule.
   - To create a content blackout schedule for a device, open the device’s details page, click Settings > Content (in the Settings panel) > Content Blackout Schedule.

3. If you are creating content blackout schedules for a device or device folder, click Override settings to activate the Content Blackout Schedule panel.

4. Click Add to display the Specify Blackout Time Period dialog box, then fill in the following fields:
   - Start Date: Select the first date you want to include in the schedule.
   - End Date: Select the last date you want to include in the schedule. The blackout time period (specified by the start and end times) occurs on each day from the start date to the end date.
   - Start Time: Select the hour you want the blackout time period to start each day.
   - End Time: Select the hour you want the blackout time period to end each day. If you want the blackout time period to extend for 24 hours, select the same time as the start time.

5. Click OK to save the blackout period.

6. Repeat Step 4 to create additional blackout periods.

7. When you are finished, click OK or Apply to save the schedule.

### 30.3 Setting the Device Refresh Schedule

At device startup, the ZENworks Adaptive Agent on a device contacts a ZENworks Server to refresh its information. If information changes after startup, the Adaptive Agent must refresh its information again before the changes can show up on the device.

If the refreshed information indicates that there is new content to be downloaded, the Adaptive Agent contacts its content server and begins the download process.

You can use the device refresh schedule to determine how often a device contacts a ZENworks Server to update bundle, policy, configuration, and registration information. Schedules can be defined at the following levels:

- **Management Zone:** The schedule is inherited by all devices.
- **Device Folder**: The schedule is inherited by all devices within the folder and its subfolders. It overrides the Management Zone schedule.
- **Device**: The schedule applies only to the device for which it is defined. It overrides any schedules set at the Management Zone and folder levels.

To create a device refresh schedule:

1. Launch ZENworks Control Center.
2. Do one of the following:
   - To create a device refresh schedule for your Management Zone, click the **Configuration** tab, then click **Device Management** (in the Management Zone Settings panel) > **Device Refresh Schedule**.
   - To create a device refresh schedule for a device folder, open the folder’s details page, then click **Settings** > **Device Management** (in the Settings panel) > **Device Refresh Schedule**.
   - To create a device refresh schedule for a device, open the device’s details page, then click **Settings** > **Content** (in the Settings panel) > **Device Refresh Schedule**.

3. If you are creating a device refresh schedule for a device or device folder, click **Override settings** to activate the Device Refresh Schedule panel, then choose from the following schedules:

   - **Manual Refresh**: If you want a device refreshed only when its user manually initiates the refresh, select **Manual Refresh**, then click **Apply**. Users can initiate a refresh by clicking the ZENworks icon located in the desktop’s notification area (system tray).
   - **Timed Refresh**: Select **Timed Refresh** if you want to establish a refresh schedule. You can use a Full Refresh Schedule or Partial Refresh Schedule:
     - **Full Refresh Schedule**: Defines how often you want a device to update all of its information from the ZENworks Server, including bundle, policy, setting, and registration information. Use the following fields to create the full refresh schedule:
     - **Days, Hours, Minutes**: Specifies the amount of time between refreshes. For example, to set a refresh interval of 8.5 hours, you would specify 0 Days, 8 Hours, 30 Minutes. The default is 12 hours.
• **Random Time to Wait**: Select this option to ensure that multiple devices with the same refresh schedule do not all initiate their refresh at the same time. For example, if you have 1000 devices with the same refresh schedule, you might overburden your ZENworks Server. By selecting this option, the device waits a randomly generated amount of time before initiating its refresh. Use the *Minimum* and *Maximum* fields to specify the range (in seconds) for the randomly generated time.

• **Partial Refresh Schedule**: Defines how often you want a device to update its policy, configuration setting, and registration information from the ZENworks Server. Bundle information is not updated.

  In the *Days*, *Hours*, and *Minutes* fields, specify the amount of time between refreshes. For example, to set a refresh interval of 3 hours, you would specify 0 Days, 3 Hours, 0 Minutes. The default is 2 hours.

The *Timed Refresh* setting is applicable to both the full and partial refreshes.

The refresh interval is not reset until the device refresh is complete. For example, assume you set a refresh interval of 8 hours. The device’s first refresh occurs at 6:00 p.m. and takes 13 seconds to complete. The second refresh occurs at 2:00:13 a.m. (8 hours after the refresh was completed at 6:00:13). If the second refresh takes 15 seconds to complete, the third refresh occurs at 10:00:28 a.m.

4 When you are finished, click *OK* or *Apply* to save the schedule.
31 Content Sharing

Content sharing helps you leverage your existing file sharing infrastructure and download the content to managed devices.

**NOTE:** Managed devices download the content from the content repository by using the HTTP protocol. They can additionally download the content by using the CIFS protocol.

For information about sharing content, see the following sections:

- Section 31.1, “Sharing the content-repo Directory on the Primary Server,” on page 107
- Section 31.2, “Sharing the content-repo Directory on a Satellite Server,” on page 110
- Section 31.3, “Configuring the Settings on a Managed Device,” on page 111

### 31.1 Sharing the content-repo Directory on the Primary Server

On the ZENworks Primary Server, you need to configure the content repository as a file system share that can be accessed as an anonymous read-only share. You must configure the content repository as read-only for preventing anonymous users from manipulating the data and causing security issues.

- Section 31.1.1, “Sharing the Content Repository on a SUSE Linux,” on page 107
- Section 31.1.2, “Sharing the Content Repository on Windows,” on page 109

#### 31.1.1 Sharing the Content Repository on a SUSE Linux

1. Install Samba.
   
   For more information on how to install Samba, see the [Samba Administration Guide](http://wwwtest.provo.novell.com/documentation/oes11/file_samba_cifs_lx/index.html?page=/documentation/oes11/file_samba_cifs_lx/data/bookinfo.html#bookinfo).

2. Launch YaST Control Center.

3. In the *Filter* field, type Samba *Server*.
The Samba Server configuration process is initialized.

4 Click Next.

The Samba Installation window is displayed.

5 In the Workgroup or Domain Name field, specify the workgroup or domain name, then click Next.

6 In the Samba Server Type option, select one of the following:
   - Primary Domain Controller (PDC)
   - Backup Domain Controller (BDC)
   - Not a Domain Controller

7 Click Next.

The Samba Configuration window is displayed.

8 In the Start-Up tab, select how you want the Samba Server to start:
   - During Boot
   - Manually

9 Click OK.

The Password dialog box is displayed.

10 Specify the Samba root password, verify the password, then click OK.

11 Select the settings for the new share.
   11a Click Shares > All users > Edit.

   The New Share window is displayed.

   11b Specify the share name, then provide a short description of the share.

   11c Select the Directory option to share the folder.

   11d Click Browse to display the Browse for Folder dialog box. Browse to and select the path that you want to share.

   11e Select the Read-Only check box to only read the files that are shared.
11f Select the Inherit ACLS check box to make new files inherit the default ACLs from the containing folder.

11g Click OK.

12 In the Share content-repo window, click Edit.

13 In the Selected Option drop-down list, select guest ok, then click OK.

14 Click OK.

31.1.2 Sharing the Content Repository on Windows

You can perform the following tasks in the order listed:

1. Enable simple file system sharing.

Windows 2003

a. Click Start > All Programs > Accessories > Windows Explorer.

b. Expand My Computer, then locate the shared folder or drive to that you want to share.

c. Right-click the folder or drive, then click Properties.

The Properties dialog box is displayed.

d. Click the Sharing tab.

e. Select the Share this folder option.

f. Specify the share name and a brief description about the folder.

g. Click Apply > OK.

Windows 7

a. Open Windows Explorer, then locate the shared folder or drive to that you want to share.

b. Right-click the folder or drive, then click Properties.

The Properties dialog box is displayed.

c. Click Sharing > Share.

d. In the Advanced Sharing panel, click Advanced Sharing.

The Advanced Sharing dialog box is displayed.
e. Select the Share this folder check box. The Settings panel is enabled.
f. Specify the share name.
g. Click Apply > OK.

2. Use the gpedit.msc method to configure the group policy settings:
   a. From the desktop Start menu, click Run.
   b. In the Open option, type gpedit.msc, then click OK.
      The Local Group Policy Editor window is displayed.
   d. Select the Network access: Let Everyone permissions apply to anonymous users option.
   e. In the Local Security Setting tab, select Enabled.
   f. Click Apply > OK.
   g. Select the Network access: Shares that can be accessed anonymously option.
   h. In the Local Security Setting tab, add the content-repo setting to the list of shares.
   i. Click Apply > OK.
   j. Restart the Server service from the Service Manager.

31.2 Sharing the content-repo Directory on a Satellite Server

To share the content repository on a Satellite Server, you must follow the procedures in Section 31.1, “Sharing the content-repo Directory on the Primary Server,” on page 107.

In addition, if the Satellite Server is a promoted Satellite Server, you must configure the settings for allowing the user to access the content-repo directory anonymously.
For Windows:

1. Open the Registry Editor.
2. Go to HKLM/Software/Novell/ZCM.
3. In the right pane, right-click New, then click String Value.
4. Rename the string value as AllowAnonymousAccessToContentRepo.
5. Double-click AllowAnonymousAccessToContentRepo. The Edit String dialog box is displayed.
6. In the Value data field, specify the value of the string as True, then Click OK.

For Linux:

In the /etc/opt/novell/zenworks/conf/xplatzmd.properties file, set the value of the AllowAnonymousAccessToContentRepo string as True.

31.3 Configuring the Settings on a Managed Device

For managed devices to download the content repository by using a CIFS share, you need to configure the following settings on every device:

For Windows:

Create the following string value in the registry on the managed device:

HKEY-LOCAL-MACHINE\SOFTWARE\Novell\ZCM

Specify the value name as PreferredContentRepo. Set the value of the string as "\<ip address>\content-repo".

For example, PreferredContentRepo = \164.99.137.82\content-repo\.

For Linux:

In the /etc/opt/novell/zenworks/conf/xplatzmd.properties file on the managed device, set the value of the PreferredContentRepo string as smb://<ip address>/<content-repo>/.

“The imaging content is replicated according to the default content replication schedule even if you change the schedule after promoting a managed device to an Imaging Satellite” on page 114.

“Content in the database is not available in the content repository” on page 114
The following sections provide solutions to the issues you might encounter during content replication.

- “After an upgrade, the size of the content repository increases” on page 113
- “Content in the database is not available in the content repository” on page 114
- “Removing the Content role from a Satellite does not remove the device from the Closest Server Default Rule and Closest Server Rules” on page 114
- “The imaging content is replicated according to the default content replication schedule even if you change the schedule after promoting a managed device to an Imaging Satellite” on page 114

**After an upgrade, the size of the content repository increases**

Source: ZENworks 11 SP2

Explanation: When you upgrade the Primary Servers, the size of the content repository increases to almost double its previous size, even though there are no new bundles and no modifications have been made to any of the content in the Zone.

Possible Cause: Files that have been deleted from the database still exist in the content repository.

Action: Perform the following steps:

**IMPORTANT:** You cannot retrieve content after you run the Delete command. We strongly recommend that you run the `novell-zenworks-configure -c CheckContentSystem` command first, to identify inconsistencies in the content. This command is applicable only for Primary Servers. After you verify the content, run the command and use the appropriate switch (delete or sync). If you have any queries, contact Novell Support for assistance.

1. Run the following command to sync the database with the content repository:
   ```bash
   novell-zenworks-configure -c CheckContentSystem
   -Dzenworks.configure.syncDb="true"
   ```

2. To identify content that is available in the content repository, but not in the database, select the Look for content in the content-repo, not in the database option.

   Files that are in the content repository and whose content sync status is not updated in database are updated. Any corruption of content in the content repository is reported if the checksum does not match the database.
3 To delete the files that are in the content repository but not in the database run the following command:

```
novell-zenworks-configure -c CheckContentSystem -Dzenworks.configure.deleteFiles="true"
```

---

**Content in the database is not available in the content repository**

**Source:** ZENworks 11 SP2  
**Explanation:** After you perform an upgrade, some files that are in the database are not available in the content repository.  
**Action:** Perform the following steps:

---

**IMPORTANT:** It is strongly recommended to run the `novell-zenworks-configure -c CheckContentSystem` command first, to identify inconsistencies in the content. This command is applicable only for Primary Servers. After you verify the content, run the command and use the appropriate switch (sync). If you have any queries, contact Novell Support for assistance.

---

1 Run the following command to sync the database with the content repository:

```
novell-zenworks-configure -c CheckContentSystem -Dzenworks.configure.syncDb="true"
```

2 To identify content that is available in the database, but not in the content repository, select the **Look for content in the database, not in the content-repo option.**

Files that are not available in the content repository are marked as **Unavailable**.

3 Perform the content replication procedure to replicate the files to the content repository.

---

**Removing the Content role from a Satellite does not remove the device from the Closest Server Default Rule and Closest Server Rules**

**Source:** ZENworks 11 SP2  
**Explanation:** If you remove the Content role from a Satellite device, the device is not automatically removed from the Closest Server Default Rule and the Closest Server Rules.  
**Action:** Remove the Satellite device from the Server Hierarchy list. In ZENworks Control Center, click the Configuration tab > select the check box next to the Satellite device, click Action, then click Remove Satellite Server.  

---

**The imaging content is replicated according to the default content replication schedule even if you change the schedule after promoting a managed device to an Imaging Satellite**

**Source:** ZENworks 11.
Explanation: If you change the Imaging content replication schedule for an Imaging Satellite, the imaging content is replicated from the Primary Server to the Satellite while promoting the managed device to the Imaging Satellite, by using the default schedule and not the revised schedule.

**NOTE:** ZENworks images are not replicated from one Primary Server to other Primary or Satellite Servers.

Action: To change the imaging content schedule after promoting a managed device to an Imaging Satellite:

1. Remove the Imaging role from the Satellite.
   
   For detailed information on how to demote a Satellite to a managed device, see Section 13, “Removing the Roles from a Satellite,” on page 53.

2. Add the Imaging role to the Satellite, then configure the desired imaging content replication schedule while configuring the role.
   
   For detailed information on how to add the Imaging role to a Satellite, see Section 10.4, “Understanding the Imaging Role,” on page 36.
Layer 4 (L4) is used to make switching decisions, which means that a switch considers the information in Layer 4 when routing a packet. For example, an L4 switch can decide where to send the packet based on the port numbers. Layer 4 information is used to direct application sessions to different servers and prioritize and queue certain packet types, such as database or application server traffic. An L4 switch requires every device along its path to be together. These switches are useful for WAN and LAN/WAN boundaries.

Each L4 switch has a slightly different method and terminology for the sticky bit or persistence bind, which allows a client that has established a session to be directed to the same Primary Server for all requests sent during the session.

If you choose to deploy Primary Servers behind a L4 switch:

- Ensure that all such Primary servers are running on the same HTTP and HTTPS ports.
- And if you have specified DNS name for L4 switch in ZCC, ensure that the specified DNS name is resolvable by all the Primary servers behind L4.

For pull deployment in ZENworks 11 to work efficiently, you must enable the sticky bit with the sticky age set to 30 minutes. After the deployment task is finished, the sticky bit configuration is not required and can be removed.

The following table lists supported and unsupported scenarios if L4 switching is used in ZENworks 11:

<table>
<thead>
<tr>
<th>Supported</th>
<th>Not Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pull deployment (Sticky bit set)</td>
<td>Push deployment</td>
</tr>
<tr>
<td>Regular managed device activity (Bundles and policy assignments, remotely controlling the devices, etc.)</td>
<td>Content Satellite</td>
</tr>
<tr>
<td>Authentication to user sources</td>
<td>Collection Satellite</td>
</tr>
<tr>
<td></td>
<td>Authentication Satellite</td>
</tr>
</tbody>
</table>

**NOTE:** System updates of managed devices, Patch Management, and Imaging scenarios have not been tested.
A.1 Predeployment Tasks

Before you begin to use the pull deployment method to deploy the ZENworks Adaptive Agent, perform the following tasks:

1 Create an L4 definition:
   1a In ZENworks Control Center, click the Configuration tab.
   1b In the Management Zone Settings panel, click Infrastructure Management, then click Closest Server Default Rule to display the Closest Server Default Rule page.
   1c Click L4 Switch > Create Empty L4 Switch Definition.
   1d In the Create Empty L4 Switch Definition dialog box, specify the IP address or DNS name of the L4 switch.
   1e Click OK.

2 Add Primary Server to the L4 switch:
   2a Select the Primary Server that you want to add to the L4 switch, then click L4 Switch > Add To L4 Switch Definition.
   2b In the Add to Existing/New L4 Switch Definition dialog box, specify the L4 IP address or DNS name for a new L4 switch definition or select an existing L4 definition from the drop-down list, then click OK.
   2c Click OK.

3 (Optional) Add an L4 switch definition to a location:
   3a Click Configuration > Locations.
   3b Select the location that you want to add to the L4 switch, then click Servers tab.
   3c Click L4 Switch > Add L4 Switch.
   3d In the Add Existing L4 Switch Definition dialog box, select an existing L4 definition from the drop-down list, then click OK.
   3e Click Apply.

4 Edit the deployment package to add the L4 switch IP address.
   For more information on how to edit the deployment package, see “Customizing Packages” in the ZENworks 11 Discovery, Deployment, and Retirement Reference.

5 On the L4 switch console, enable the sticky bit or persistent bind with the stick age set to 30 minutes.
   For more information on how to enable the sticky bit, refer to your L4 switch vendor documentation.
You can schedule to run ZENworks components based on your requirements. The following schedules are available:

- Section B.1, “Date Specific,” on page 119
- Section B.2, “Event,” on page 120
- Section B.3, “Now,” on page 121
- Section B.4, “Recurring,” on page 121

### B.1 Date Specific

The Date Specific scheduling option lets you specify one or more dates on which to run the event.

*Figure B-1  Date Specific Schedule*

**Start Dates:** Click to display a calendar you can use to select a date for the event. You can add multiple dates one at a time.

**Run Event Every Year:** Select this option to run the event every year on the dates shown in the *Start Date(s)* list.

**Process Immediately if Device Unable to Execute on Schedule:** For some reason, if the event does not run on the schedule you configured, to trigger the event immediately, select *Process immediately if device unable to execute on schedule.*
Select When Schedule Execution Should Start: Select one of the following options:

- **Start Immediately at Start Time:** Starts the event at the time you specify in the Start Time field.
- **Start at a Random Time between Start Time and End Time:** Starts the event at a randomly selected time between the time you specify in the Start Time and End Time fields. You can use this option to avoid possible network overload from concurrently scheduled events.

**Use Coordinated Universal Time (UTC):** The Start Time is converted to Universal Coordinated Time (UTC). Recommended, if the management zone is across geographical locations. Select this option to indicate that the Start Time you entered is already in Coordinated Universal Time and should not be converted. For example, suppose you are in the Eastern time zone. If you enter 10:00 a.m. and select this option, the Start Time is scheduled for 10:00 UTC. If you don’t select this option, the Start Time is scheduled for 14:00 UTC because Eastern time is UTC - 4 hours.

### B.2 Event

This scheduling option lets you specify the event you want, to trigger the scheduled action.

**NOTE**

- User management is supported only on Windows platforms.
- Event Schedule type is not supported for Inventory Scans.
- Event Schedules are not supported on Linux and Macintosh devices.

**Figure B-2 Event Schedule**

![Event Schedule Diagram](image)

Select from the following triggers:

**User Login:** A user logs in to the device’s operating system.

**User Logout:** A user logs out of the device’s operating system. This is not applicable if a user shuts down, or reboots the system.

**Device Boot:** The device powers on.

**On Device Lock:** The device’s operating system is locked.
On Device Unlock: The device’s operating system is unlocked.

ZENworks Login: A user logs in to the ZENworks Management Zone.

ZENworks Logout: A user logs out of the ZENworks Management Zone.

Device Connecting to Network (Windows Only): The disconnected device detects a new wired or wireless network connection.

NOTE

At device startup, the ZENworks Adaptive Agent contacts a ZENworks Server according to the device's refresh schedule to refresh its bundle, policy, configuration, and registration information. If information changes, the Adaptive Agent must refresh its information before the changes can show up on the device, even if one of the event triggers occur. By default, devices refresh randomly between 300 and 360 seconds after device startup with a full refresh every 12 hours.

For example, if you create a bundle and schedule it to launch when the device connects to the network, the device must be manually refreshed or refreshed according to schedule before the Adaptive Agent can upload or launch the bundle, even if the device connects to the network.

B.3 Now

Select this scheduling option to run the event immediately.

B.4 Recurring

The Recurring scheduling option lets you repeat the event at a specified interval.

NOTE: The following sections describe all of the Recurring schedule options. Depending on the event or action you are scheduling, some options might not be available.
When a Device Is Refreshed: This schedule causes the event to occur each time the ZENworks Adaptive Agent performs a refresh on the device. If you want to delay the event so that it does not happen immediately upon refresh, select the Delay execution after refresh option and specify the number of days, hours, or minutes you want to delay the event.

Days of the Week: This schedule lets you specify the days during the week that you want the event to run. The event is run on these same days each week.

Select Days of the Week, then fill in the following fields:

- **Sun... Sat**: Specifies the days of the week you want to run the event.
- **Start Time**: Specifies the time you want to run the event.
- **Process Immediately if Device Unable to Execute on Schedule**: For some reason, if the event does not run on the schedule you configured, to trigger the event immediately, select Process immediately if device unable to execute on schedule.
- **Use Coordinated Universal Time**: The Start Time is converted to Universal Coordinated Time (UTC). Recommended, if the management zone is across geographical locations. Select this option to indicate that the Start Time you entered is already in Coordinated Universal Time and should not be converted. For example, suppose you are in the Eastern time zone. If you enter 10:00 a.m. and select this option, the Start Time is scheduled for 10:00 UTC. If you don’t select this option, the Start Time is scheduled for 14:00 UTC because Eastern time is UTC - 4 hours.
**Start at a Random Time between Start Time and End Time:** Starts the event at a randomly selected time between the time you specify in the Start Time and End Time fields. You can use this option to avoid possible network overload from concurrently scheduled events.

**Restrict Schedule Execution to the Following Date Range:** Limits running the event to the time period specified by the starting and ending dates.

**Monthly:** This schedule lets you specify one or more days during the month to run the event.

Select **Monthly**, then fill in the following fields:

- **Day of the Month:** Specifies the day of the month to run the event. Valid entries are 1 through 31. If you specify 29, 30, or 31 and a month does not have those days, the event is not run that month.
- **Last Day of the Month:** Runs the event on the last day of the month, regardless of its date (28, 30, or 31).
- **First Sunday:** Specifies a specific day of a week. For example, the first Monday or the third Tuesday. Click to add multiple days.
- **Start Time:** Specifies the time you want to run the event.
- **Process Immediately if Device Unable to Execute on Schedule:** For some reason, if the event does not run on the schedule you configured, to trigger the event immediately, select **Process immediately if device unable to execute on schedule**.
- **Use Coordinated Universal Time:** The Start Time is converted to Universal Coordinated Time (UTC). Recommended, if the management zone is across geographical locations. Select this option to indicate that the Start Time you entered is already in Coordinated Universal Time and should not be converted. For example, suppose you are in the Eastern time zone. If you enter 10:00 a.m. and select this option, the Start Time is scheduled for 10:00 UTC. If you don’t select this option, the Start Time is scheduled for 14:00 UTC because Eastern time is UTC - 4 hours.

**Fixed Interval:** This schedule lets you specify an interval between days to run the event. For example, you can run the event every 14 days.

Select **Fixed Interval**, then fill in the following fields:

- **Months, Weeks, Days, Hours, Minutes:** Specifies the interval between times when the event is run. You can use any combination of months, weeks, days, hours, and minutes. For example, both 7 days, 8 hours and 1 week, 8 hours provide the same schedule.
- **Start Date:** Specifies the initial start date for the interval.
- **Start Time:** Specifies the initial start time for the interval.
- **Process Immediately if Device Unable to Execute on Schedule:** For some reason, if the event does not run on the schedule you configured, to trigger the event immediately, select **Process immediately if device unable to execute on schedule**.
- **Use Coordinated Universal Time:** The Start Time is converted to Universal Coordinated Time (UTC). Recommended, if the management zone is across geographical locations. Select this option to indicate that the Start Time you entered is already in Coordinated Universal Time and should not be converted. For example, suppose you are in the Eastern time zone. If you enter 10:00 a.m. and select this option, the Start Time is scheduled for 10:00 UTC. If you don’t select this option, the Start Time is scheduled for 14:00 UTC because Eastern time is UTC - 4 hours.
- **Restrict Schedule Execution to the Following Date Range**: Limits running of the event to the time period specified by the start date, end date, and end time.
Understanding Communication between ZENworks Components in Multi-Locale Environment

If you choose to run the ZENworks Primary Server, ZENworks Control Center, and ZENworks Adaptive Agent on operating systems with different locales, review the following points to understand the communication behavior between ZENworks components:

- ZENworks 11 extends support to the following languages:
  - Single-byte languages: English, French, German, Italian, Portuguese, and Spanish
  - Double-byte languages: Chinese-Traditional, Chinese-Simplified, and Japanese
- ZENworks Primary Server is language independent. It can render messages in all the languages supported by ZENworks.
- It is recommended to launch ZENworks Control Center in the same locale as the operating system locale of the management console.
  For example, if the operating system locale of the management console is German, you must launch ZENworks Control Center in German.
  You can choose to launch ZENworks Control Center in a locale different from the operating system of the management console only if the device has the necessary language support packs installed.
- ZENworks 11 uses UTF-8 encoding for ZENworks textual messages and local encoding for standard Windows messages. If ZENworks Control Center is launched in a locale that is different from the operating system locale of the ZENworks Adaptive Agent, the ZENworks messages that are sent by the agent are only translated and displayed in the ZENworks Control Center locale. The standard Windows messages are displayed in the operating system locale of the management console.
  For example, assume that the operating system locale of the ZENworks Adaptive Agent is German and the operating system locale of the management console is French. If you choose to launch ZENworks Control Center in French, the ZENworks messages from the agent are displayed in French and not in German in ZENworks Control Center. The Windows messages sent from the agent are displayed in French.
- During Remote Management sessions and Remote Management operations that are triggered by the ZENworks Icon, all messages and user prompts are displayed on the managed device in the language of its operating system locale. During a Remote Management session, the keystrokes are translated according to the management console keyboard; the agent simulates the virtual key codes it receives from the viewer.
  If the operating system locale of the managed device is a single-byte locale supported by ZENworks, you can choose to launch Remote Viewer in any single-byte locale supported by ZENworks. For example, if the locale of the operating system of the managed device is French, you can launch the Remote Viewer in any of the following locales: English, French, German, Italian, Portuguese, or Spanish.
If the operating system locale of the managed device is a double-byte locale supported by ZENworks, you must launch ZENworks Control Center in the same double-byte locale as the operating system locale of the management console, or in English. For example, if the locale of the operating system of the managed device is Japanese, you must launch the Remote Viewer in either Japanese or English.

**Table C-1 Supported Compatibility Matrix between the Operating System Locale of the Managed Device and ZENworks Control Center Locale**

This section contains information on documentation content changes that were made in this ZENworks Primary Server and Satellite Reference for Novell ZENworks 11 SP2 release. The information can help you to keep current on updates to the documentation.

The documentation for this product is provided on the Web in two formats: HTML and PDF. The HTML and PDF documentation are both kept up-to-date with the changes listed in this section.

If you need to know whether a copy of the PDF documentation that you are using is the most recent, the PDF document includes a publication date on the title page.

The following updates were made to the document:

### E.1 March 2013: Update for ZENworks 11 SP2 (11.2.3)

Updates were made to the following sections:

<table>
<thead>
<tr>
<th>Location</th>
<th>Update</th>
</tr>
</thead>
</table>
• New field added, see “Satellite Server Output Throttle Rate (in kbps):” on page 41.  
• Included step 5 with all new fields, see  
  • “Use Parent Primary Server Only:” on page 42.  
  • “Use Closest Content Servers First:” on page 42.  
  • “Use Closest Content Servers Only:” on page 42.  
  • Created a new Section 11.6, “Satellite Server Output Throttle Rate Calculations,” on page 48. |
| Chapter 29, “Content Replication,” on page 95. | Created two new sections:  
  • Section 29.5, “Replicating Content to Primary Servers,” on page 101.  
  • Section 29.6, “Cleaning up Content from the Primary Server,” on page 101. |
<p>| Section 29.2, “Replicating Content to New Content Servers,” on page 97 | Updated with Search option. |</p>
